Kengo Nakajima

Programming for Parallel Computing (616-2057)
Seminar on Advanced Computing (616-4009)

- Overview
- Distributed Local Data
- Program
- Results

1D Steady State Heat Conduction

$$\frac{\partial}{\partial x} \left(\lambda \frac{\partial T}{\partial x} \right) + \dot{Q} = 0$$

- **Uniform: Sectional Area: A , Thermal Conductivity: λ**
- Heat Generation Rate/Volume/Time [$QL^{-3}T^{-1}$] $\dot{Q}$
- Boundary Conditions
 - $x=0$: $T=0$ (Fixed Temperature)
 - $x=x_{max}$: $\frac{\partial T}{\partial x} = 0$ (Insulated)

1D Steady State Heat Conduction

$$\frac{\partial}{\partial x} \left(\lambda \frac{\partial T}{\partial x} \right) + \dot{Q} = 0$$

- **Uniform: Sectional Area: A , Thermal Conductivity: λ**
- Heat Generation Rate/Volume/Time [$QL^{-3}T^{-1}$] $\dot{Q}$
- Boundary Conditions
 - $x=0$: $T=0$ (Fixed Temperature)
 - $x=x_{max}$: $\frac{\partial T}{\partial x} = 0$ (Insulated)

Analytical Solution

$$\frac{\partial}{\partial x} \left(\lambda \frac{\partial T}{\partial x} \right) + \dot{Q} = 0$$

$$T = 0 @ x = 0$$

$$\frac{\partial T}{\partial x} = 0 @ x = x_{max}$$

$$\lambda T'' = -\dot{Q}$$

$$\lambda T' = -\dot{Q}x + C_1 \Rightarrow C_1 = \dot{Q}x_{max}, \quad T' = 0 @ x = x_{max}$$

$$\lambda T = -\frac{1}{2}\dot{Q}x^2 + C_1x + C_2 \Rightarrow C_2 = 0, \quad T = 0 @ x = 0$$

$$\therefore T = -\frac{1}{2\lambda}\dot{Q}x^2 + \frac{\dot{Q}x_{max}}{\lambda}x$$

Copy and Compile

Fortran

```
>$ cd <$0-TOP>  
>$ cp /home/z30088/class_eps/F/s2r-f.tar .  
>$ tar xvf s2r-f.tar
```

C

```
>$ cd <$0-TOP>  
>$ cp /home/z30088/class_eps/C/s2r-c.tar .  
>$ tar xvf s2r-c.tar
```

Confirm/Compile

```
>$ cd mpi/S2-ref  
>$ mpifrtpx -Kfast 1d.f  
>$ mpifccpx -Kfast 1d.c
```

<\$0-S2r> = <\$0-TOP>/mpi/S2-ref

Procedures for Parallel FEM

- Reading control file, entire element number etc.
- Creating “distributed local data” in the program
- Assembling local and global matrices for linear solvers
- Solving linear equations by CG
- Not so different from those of original code

- Overview
- **Distributed Local Data**
- Program
- Results

Finite Element Procedures

- Initialization
 - Control Data
 - Node, Connectivity of Elements (N: Node#, NE: Elem#)
 - Initialization of Arrays (Global/Element Matrices)
 - Element-Global Matrix Mapping (Index, Item)
- Generation of Matrix
 - Element-by-Element Operations (do icel= 1, NE)
 - Element matrices
 - Accumulation to global matrix
 - Boundary Conditions
- Linear Solver
 - Conjugate Gradient Method

Quadrilateral Elements

Node-based partitioning
Independent variables are defined at nodes (vertices).

Information is not sufficient for assembling coefficient matrices.

Info. of nodes and elements in overlapped zones are required for assembling coef. matrices.
Computation of stress components needs same info.

Distributed Local Data Structure for Parallel FEM

- **Node-based partitioning**
- Local data includes:
 - Nodes originally assigned to the domain/PE/partition
 - Elements which include above nodes
 - Nodes which are included above elements, and originally NOT-assigned to the domain/PE/partition
- 3 categories for nodes
 - **Internal nodes** Nodes originally assigned to the domain/PE/partition
 - **External nodes** Nodes originally NOT-assigned to the domain/PE/partition
 - **Boundary nodes** External nodes of other domains/PE's/partitions
- Communication tables
- Global info. is not needed except relationship between domains
 - Property of FEM: local element-by-element operations

Node-based Partitioning

internal nodes - elements - external nodes

Node-based Partitioning

internal nodes - elements - external nodes

- Partitioned nodes themselves (Internal Nodes) 内点
- Elements which include Internal Nodes 内点を含む要素
- External Nodes included in the Elements 外点
in overlapped region among partitions.
- Info of External Nodes are required for completely local element-based operations on each processor.

1D FEM: 12 nodes/11 elem's/3 domains

Description of Distributed Local Data

- Internal/External Points
 - Numbering: Starting from internal pts, then external pts after that
- Neighbors
 - Shares overlapped meshes
 - Number and ID of neighbors
- External Points
 - From where, how many, and which external points are received/imported ?
- Boundary Points
 - To where, how many and which boundary points are sent/exported ?

1D FEM: 12 nodes/11 elem's/3 domains

Local ID: Starting from 0 for node and elem at each domain

1D FEM: 12 nodes/11 elem's/3 domains

Internal/External Nodes

1D FEM: Numbering of Local ID

#0:
N+1 nodes
N elements

#PETot-1:
N+1 nodes
N elements

Others (General):
N+2 nodes
N+1 elements

1D FEM: 12 nodes/11 elem's/3 domains

Integration on each element, element matrix -> global matrix
Operations can be done by info. of internal/external nodes and elements which include these nodes

Preconditioned Conjugate Gradient Method (CG)

```

Compute  $\mathbf{r}^{(0)} = \mathbf{b} - [\mathbf{A}]\mathbf{x}^{(0)}$ 
for i= 1, 2, ...
  solve  $[\mathbf{M}]\mathbf{z}^{(i-1)} = \mathbf{r}^{(i-1)}$ 
   $\rho_{i-1} = \mathbf{r}^{(i-1)} \mathbf{z}^{(i-1)}$ 
  if i=1
     $\mathbf{p}^{(1)} = \mathbf{z}^{(0)}$ 
  else
     $\beta_{i-1} = \rho_{i-1} / \rho_{i-2}$ 
     $\mathbf{p}^{(i)} = \mathbf{z}^{(i-1)} + \beta_{i-1} \mathbf{p}^{(i-1)}$ 
  endif
   $\mathbf{q}^{(i)} = [\mathbf{A}]\mathbf{p}^{(i)}$ 
   $\alpha_i = \rho_{i-1} / \mathbf{p}^{(i)} \mathbf{q}^{(i)}$ 
   $\mathbf{x}^{(i)} = \mathbf{x}^{(i-1)} + \alpha_i \mathbf{p}^{(i)}$ 
   $\mathbf{r}^{(i)} = \mathbf{r}^{(i-1)} - \alpha_i \mathbf{q}^{(i)}$ 
  check convergence  $|\mathbf{r}|$ 
end

```

Preconditioning:
Diagonal Scaling
(or Point Jacobi)

Preconditioning, DAXPY

Local Operations by Only Internal Points: Parallel Processing is possible

```
/*  
//-- {z}= [Minv]{r}  
*/  
for(i=0;i<N;i++){  
    W[Z][i] = W[DD][i] * W[R][i];  
}
```

```
/*  
//-- {x}= {x} + ALPHA*{p}  
//    {r}= {r} - ALPHA*{q}  
*/  
for(i=0;i<N;i++){  
    U[i] += Alpha * W[P][i];  
    W[R][i] -= Alpha * W[Q][i];  
}
```

Matrix-Vector Products

Values at External Points: P-to-P Communication

```
/*  
//-- {q} = [A] {p}  
*/  
for (i=0; i<N; i++) {  
    W[Q][i] = Diag[i] * W[P][i];  
    for (j=Index[i]; j<Index[i+1]; j++) {  
        W[Q][i] += AMat[j]*W[P][Item[j]];  
    }  
}
```

1D FEM: 12 nodes/11 elem's/3 domains

Internal/External Nodes

Mat-Vec Products: Local Op. Possible

Mat-Vec Products: Local Op. Possible

Mat-Vec Products: Local Op. Possible

=

Mat-Vec Products: Local Op. #1

Description of Distributed Local Data

- Internal/External Points
 - Numbering: Starting from internal pts, then external pts after that
- Neighbors
 - Shares overlapped meshes
 - Number and ID of neighbors
- External Points
 - From where, how many, and which external points are received/imported ?
- Boundary Points
 - To where, how many and which boundary points are sent/exported ?

Boundary Nodes (境界点) : SEND

PE#2 : send information on “boundary nodes”

SEND: MPI_Isend/Irecv/Waitall

SendBuf

export_item (export_index[neib]:export_index[neib+1]-1) are sent to neib-th neighbor

```
for (neib=0; neib<NeibPETot;neib++){
    for (k=export_index[neib];k<export_index[neib+1];k++){
        kk= export_item[k];
        SendBuf[k]= VAL[kk];
    }
}
```

Copied to sending buffers

```
for (neib=0; neib<NeibPETot; neib++){
    tag= 0;
    iS_e= export_index[neib];
    iE_e= export_index[neib+1];
    BUFlength_e= iE_e - iS_e

    ierr= MPI_Isend
        (&SendBuf[iS_e], BUFlength_e, MPI_DOUBLE, NeibPE[neib], 0,
         MPI_COMM_WORLD, &ReqSend[neib])
}
```

```
MPI_Waitall(NeibPETot, ReqSend, StatSend);
```

External Nodes (外点) : RECEIVE

PE#2 : receive information for “external nodes”

RECV: MPI_Isend/Irecv/Waitall

```
for (neib=0; neib<NeibPETot; neib++){
    tag= 0;
    iS_i= import_index[neib];
    iE_i= import_index[neib+1];
    BUFlength_i= iE_i - iS_i

    ierr= MPI_Irecv
        (&RecvBuf[iS_i], BUFlength_i, MPI_DOUBLE, NeibPE[neib], 0,
         MPI_COMM_WORLD, &ReqRecv[neib])
}

MPI_Waitall(NeibPETot, ReqRecv, StatRecv);

for (neib=0; neib<NeibPETot;neib++){
    for (k=import_index[neib];k<import_index[neib+1];k++){
        kk= import_item[k];
        VAL[kk]= RecvBuf[k];
    }
}
```

Copied from receiving buffer

import_item (import_index[neib]:import_index[neib+1]-1) are received from neib-th neighbor

RecvBuf

```

Parameters are sent to each process
from Process #0.

Diagram illustrating a broadcast operation:

Initial state (Left):

P#0	A0	B0	C0	D0
P#1				
P#2				
P#3				

Broadcast operation (Arrow):

Final state (Right):

P#0	A0	B0	C0	D0
P#1	A0	B0	C0	D0
P#2	A0	B0	C0	D0
P#3	A0	B0	C0	D0

- Broadcasts a message from the process with rank "root" to all other processes of the communicator
- **MPI_Bcast (buffer, count, datatype, root, comm)**
 - **buffer** choice I/O starting address of buffer
type is defined by "datatype"
 - **count** int I number of elements in send/receive buffer
 - **datatype** MPI_Datatype I data type of elements of send/recive buffer
 - FORTTRAN MPI_INTEGER, MPI_REAL, MPI_DOUBLE_PRECISION, MPI_CHARACTER etc.
 - C MPI_INT, MPI_FLOAT, MPI_DOUBLE, MPI_CHAR etc.
 - **root** int I rank of root process
 - **comm** MPI_Comm I communicator

N+1 elements

MPI_Isend

- Begins a non-blocking send
 - Send the contents of sending buffer (starting from **sendbuf**, number of messages: **count**) to **dest** with **tag** .
 - Contents of sending buffer cannot be modified before calling corresponding **MPI_Waitall**.

- **MPI_Isend**

(sendbuf, count, datatype, dest, tag, comm, request)

- sendbuf choice I starting address of sending buffer
- count int I number of elements in sending buffer
- datatype MPI_Datatype I datatype of each sending buffer element
- dest int I rank of destination
- tag int I message tag

This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI_Isend and MPI_Irecv are matched. Usually tag is set to be "0" (in this class),
- comm MPI_Comm I communicator
- request MPI_Request 0 communication request array used in MPI_Waitall

MPI_Irecv

- Begins a non-blocking receive
 - Receiving the contents of receiving buffer (starting from **recvbuf**, number of messages: **count**) from **source** with **tag** .
 - Contents of receiving buffer cannot be used before calling corresponding **MPI_Waitall**.

- **MPI_Irecv**

(recvbuf, count, datatype, source, tag, comm, request)

- recvbuf choice I starting address of receiving buffer
- count int I number of elements in receiving buffer
- datatype MPI_Datatype I datatype of each receiving buffer element
- source int I rank of source
- tag int I message tag

This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI_Isend and MPI_Irecv are matched. Usually tag is set to be "0" (in this class),
- comm MPI_Comm I communicator
- request MPI_Request 0 communication request array used in MPI_Waitall

MPI_Waitall

- **MPI_Waitall** blocks until all comm's, associated with request in the array, complete. It is used for synchronizing MPI_Isend and MPI_Irecv in this class.
- At sending phase, contents of sending buffer cannot be modified before calling corresponding **MPI_Waitall**. At receiving phase, contents of receiving buffer cannot be used before calling corresponding **MPI_Waitall**.
- MPI_Isend and MPI_Irecv can be synchronized simultaneously with a single **MPI_Waitall** if it is consistent.
 - Same request should be used in MPI_Isend and MPI_Irecv.
- Its operation is similar to that of **MPI_Barrier** but, **MPI_Waitall** can not be replaced by **MPI_Barrier**.
 - Possible troubles using **MPI_Barrier** instead of **MPI_Waitall**: Contents of **request** and **status** are not updated properly, very slow operations etc.
- **MPI_Waitall (count, request, status)**
 - count int I number of processes to be synchronized
 - request MPI_Request I/O comm. request used in MPI_Waitall (array size: count)
 - status MPI_Status 0 array of status objects

MPI_STATUS_SIZE: defined in 'mpif.h', 'mpi.h'

Generalized Comm. Table: Send

Local Matrix

We really need these parts:

MAT_ASS_MAIN: Overview

```

do kpn= 1, 2      Gaussian Quad. points in  $\zeta$ -direction
  do jpn= 1, 2    Gaussian Quad. points in  $\eta$ -direction
    do ipn= 1, 2  Gaussian Quad. Pointe in  $\xi$ -direction
      Define Shape Function at Gaussian Quad. Points (8-points)
      Its derivative on natural/local coordinate is also defined.
    enddo
  enddo
enddo

```

```

do icel= 1, ICELTOT  Loop for Element
  Jacobian and derivative on global coordinate of shape functions at
  Gaussian Quad. Points are defined according to coordinates of 8 nodes. (JACOBI)

```

```

do ie= 1, 8          Local Node ID
  do je= 1, 8        Local Node ID
    Global Node ID: ip, jp
    Address of  $A_{ip,jp}$  in "item" : kk

    do kpn= 1, 2      Gaussian Quad. points in  $\zeta$ -direction
      do jpn= 1, 2    Gaussian Quad. points in  $\eta$ -direction
        do ipn= 1, 2  Gaussian Quad. points in  $\xi$ -direction
          integration on each element
          coefficients of element matrices
          accumulation to global matrix
        enddo
      enddo
    enddo
  enddo
enddo
enddo
enddo

```

MAT_ASS_MAIN visits all elements

including overlapped elements with external nodes

Therefore, we have this matrix

But components of this part are not complete, and not used in computation

Program: 1d.c (9/11)

Boundary Cond., ALMOST NO changes from 1-CPU code

```
/*
// +-----+
// | BOUNDARY conditions |
// +-----+
*/

/* X=Xmin */
if (MyRank==0) {
    i=0;
    jS= Index[i];
    AMat[jS]= 0.0;
    Diag[i]= 1.0;
    Rhs [i]= 0.0;

    for (k=0;k<NPLU;k++) {
        if (Item[k]==0) {AMat[k]=0.0;}
    }
}
```

The diagram illustrates three 1D grids, labeled #0, #1, and #2, each with nodes and indices. Grid #0 (top) has nodes 0, 1, 2, 3, 4 with indices 0, 1, 2, 3, 4. Grid #1 (middle) has nodes 4, 0, 1, 2, 3, 5 with indices 3, 0, 1, 2, 4, 5. Grid #2 (bottom) has nodes 4, 0, 1, 2, 3 with indices 3, 0, 1, 2, 3. Arrows indicate connections between nodes across grid boundaries: from node 3 of #0 to node 4 of #1, and from node 5 of #1 to node 4 of #2.

Program: 1d.c(10/11)

Conjugate Gradient Method

```

/*
// +-----+
// | CG iterations |
// +-----+
//=== */
R = calloc(NP, sizeof(double));
Z = calloc(NP, sizeof(double));
P = calloc(NP, sizeof(double));

for(i=0;i<N;i++){
    DD[i]= 1.0 / Diag[i];
}

/*
//-- {r0}= {b} - [A]{xini} |
*/
for(neib=0;neib<NeibPETot;neib++){
    for(k=export_index[neib];k<export_index[neib+1];k++){
        kk= export_item[k];
        SendBuf[k]= U[kk];
    }
}

```

```

Compute  $r^{(0)} = b - [A]x^{(0)}$ 
for i= 1, 2, ...
    solve  $[M]z^{(i-1)} = r^{(i-1)}$ 
     $\rho_{i-1} = r^{(i-1)} z^{(i-1)}$ 
    if i=1
         $p^{(1)} = z^{(0)}$ 
    else
         $\beta_{i-1} = \rho_{i-1} / \rho_{i-2}$ 
         $p^{(i)} = z^{(i-1)} + \beta_{i-1} p^{(i-1)}$ 
    endif
     $q^{(i)} = [A]p^{(i)}$ 
     $\alpha_i = \rho_{i-1} / p^{(i)} q^{(i)}$ 
     $x^{(i)} = x^{(i-1)} + \alpha_i p^{(i)}$ 
     $r^{(i)} = r^{(i-1)} - \alpha_i q^{(i)}$ 
    check convergence |r|
end

```

Conjugate Gradient Method (CG)

- Matrix-Vector Multiply
- Dot Product
- Preconditioning: in the same way as 1CPU code
- DAXPY: in the same way as 1CPU code

Preconditioning, DAXPY

```
/*  
//-- {z} = [Minv] {r}  
*/  
    for (i=0; i<N; i++) {  
        Z[i] = DD[i] * R[i];  
    }
```

```
/*  
//-- {x} = {x} + ALPHA*{p}  
//   {r} = {r} - ALPHA*{q}  
*/  
    for (i=0; i<N; i++) {  
        U[i] += Alpha * P[i];  
        R[i] -= Alpha * Q[i];  
    }
```

Matrix-Vector Multiply (1/2)

Using Comm. Table, {p} is updated before computation

```
/*  
/-- {q} = [A] {p}  
*/  
for(neib=0;neib<NeibPETot;neib++) {  
    for(k=export_index[neib];k<export_index[neib+1];k++) {  
        kk= export_item[k];  
        SendBuf[k]= P[kk];  
    }  
}  
  
for(neib=0;neib<NeibPETot;neib++) {  
    is = export_index[neib];  
    len_s= export_index[neib+1] - export_index[neib];  
    MPI_Isend(&SendBuf[is], len_s, MPI_DOUBLE, NeibPE[neib],  
             0, MPI_COMM_WORLD, &RequestSend[neib]);  
}  
  
for(neib=0;neib<NeibPETot;neib++) {  
    ir = import_index[neib];  
    len_r= import_index[neib+1] - import_index[neib];  
    MPI_Irecv(&RecvBuf[ir], len_r, MPI_DOUBLE, NeibPE[neib],  
             0, MPI_COMM_WORLD, &RequestRecv[neib]);  
}  
  
MPI_Waitall(NeibPETot, RequestRecv, StatRecv);  
  
for(neib=0;neib<NeibPETot;neib++) {  
    for(k=import_index[neib];k<import_index[neib+1];k++) {  
        kk= import_item[k];  
        P[kk]=RecvBuf[k];  
    }  
}
```

Matrix-Vector Multiply (2/2)

$$\{q\} = [A]\{p\}$$

```
MPI_Waitall(NeibPETot, RequestSend, StatSend);
```

```
for (i=0; i<N; i++) {  
    Q[i] = Diag[i] * P[i];  
    for (j=Index[i]; j<Index[i+1]; j++) {  
        Q[i] += AMat[j]*P[Item[j]];  
    }  
}
```

Dot Product

Global Summation by MPI_Allreduce

```
/*  
//-- RH0= {r} {z}  
*/  
    Rho0= 0.0;  
    for (i=0; i<N; i++) {  
        Rho0 += R[i] * Z[i];  
    }  
  
    ierr = MPI_Allreduce(&Rho0, &Rho, 1, MPI_DOUBLE,  
                        MPI_SUM, MPI_COMM_WORLD);
```

P#0	A0	B0	C0	D0

P#1				
P#2				
P#3				

- Reduces values on all processes to a single value
 - Summation, Product, Max, Min etc.
- **MPI_Reduce** (**sendbuf, recvbuf, count, datatype, op, root, comm**)
 - **sendbuf** choice I starting address of send buffer
 - **recvbuf** choice 0 starting address receive buffer
type is defined by "**datatype**"
 - **count** int I number of elements in send/receive buffer
 - **datatype** MPI_Datatype I data type of elements of send/recive buffer
 - FORTAN MPI_INTEGER, MPI_REAL, MPI_DOUBLE_PRECISION, MPI_CHARACTER etc.
 - C MPI_INT, MPI_FLOAT, MPI_DOUBLE, MPI_CHAR etc
 - **op** MPI_Op I reduce operation
 - MPI_MAX, MPI_MIN, MPI_SUM, MPI_PROD, MPI_LAND, MPI_BAND etc
 - Users can define operations by **MPI_OP_CREATE**
 - **root** int I rank of root process
 - **comm** MPI_Comm I communicator

Send/Receive Buffer (Sending/Receiving)

- Arrays of “send (sending) buffer” and “receive (receiving) buffer” often appear in MPI.
- Addresses of “send (sending) buffer” and “receive (receiving) buffer” must be different.

Example of MPI_Reduce (1/2)

```
call MPI_REDUCE  
(sendbuf, recvbuf, count, datatype, op, root, comm, ierr)
```

```
real(kind=8):: X0, X1  
  
call MPI_REDUCE  
(X0, X1, 1, MPI_DOUBLE_PRECISION, MPI_MAX, 0, <comm>, ierr)
```

```
real(kind=8):: X0(4), XMAX(4)  
  
call MPI_REDUCE  
(X0, XMAX, 4, MPI_DOUBLE_PRECISION, MPI_MAX, 0, <comm>, ierr)
```

Global Max values of X0[i] go to XMAX[i] on #0 process (i=0~3)

Example of MPI_Reduce (2/2)

```
call MPI_REDUCE  
(sendbuf, recvbuf, count, datatype, op, root, comm, ierr)
```

```
real(kind=8):: X0, XSUM  
  
call MPI_REDUCE  
(X0, XSUM, 1, MPI_DOUBLE_PRECISION, MPI_SUM, 0, <comm>, ierr)
```

Global summation of X0 goes to XSUM on #0 process.

```
real(kind=8):: X0(4)  
  
call MPI_REDUCE  
(X0(1), X0(3), 2, MPI_DOUBLE_PRECISION, MPI_SUM, 0, <comm>, ierr)
```

- Global summation of X0[0] goes to X0[2] on #0 process.
- Global summation of X0[1] goes to X0[3] on #0 process.

MPI_Allreduce

- MPI_Reduce + MPI_Bcast
- Summation (of dot products) and MAX/MIN values are likely to utilized in each process
- call MPI_Allreduce
(sendbuf, recvbuf, count, datatype, op, comm)
 - sendbuf choice I starting address of send buffer
 - recvbuf choice 0 starting address receive buffer
type is defined by "datatype"
 - count int I number of elements in send/receive buffer
 - datatype MPI_Datatype I data type of elements of send/recive buffer
 - op MPI_Op I reduce operation
 - comm MPI_Comm I communicator

CG method (1/5)

```

Results for CG Solver

Time for 100 Iterations in $N=10^6$ case

based on
a core

based on
a node (16 cores)

Performance is lower than ideal one

- Time for MPI communication
 - Time for sending data
 - Communication bandwidth between nodes
 - Time is proportional to size of sending/receiving buffers
- Time for starting MPI
 - latency
 - does not depend on size of buffers
 - depends on number of calling, increases according to process #
 - $O(10^0)$ - $O(10^1)$ μsec .
- Synchronization of MPI
 - Increases according to number of processes

Performance is lower than ideal one (cont.)

- If computation time is relatively small (N is small in S1-3), these effects are not negligible.
 - If the size of messages is small, effect of “latency” is significant.

Performance is not so good... between 1-16 cores

based on performance at a single core

- x 7.1 at 16 cores, because of memory contention
 - STREAM
 - NOT mainly because of communication overhead

Not so significant in S1-3

- ◆ : $N=10^6$, ● : 10^8 , ▲ : 10^9 , — : Ideal
- Based on performance at a single core (sec.)
- Trapezoidal rule: requirement for memory is very small (no arrays), NON memory-bound application

Super-Linear in Strong Scaling

- In strong scaling case where entire problem size is fixed, performance is generally lower than the ideal one due to communication overhead.
- But sometime, actual performance may be better than the ideal one. This is called “super-linear”
 - only for scalar processors
 - does not happen in vector processors

Typical Behaviors

IBM-SP3:
Higher performance for small problems,
effect of cache

Earth Simulator:
Higher performance for large-scale
problems with longer loops

Strong Scaling

IBM-SP3:

“Super-linear” happens if number of PE is not so large. Performance is getting worse due to communication overhead if PE number is larger.

Earth Simulator:

Performance is getting worse due to communication overhead and smaller loop length if PE number is larger.

Why does “Super-Linear” happen ?

- Effect of Cache
- In scalar processors, performance for smaller problem is generally better.
 - Cache is well-utilized.

Memory Copy is expensive (1/2)

SendBuf

export_index[0] export_index[1] export_index[2] export_index[3] export_index[4]

export_item (export_index[neib]:export_index[neib+1]-1) are sent to neib-th neighbor

```
for (neib=0; neib<NeibPETot;neib++){
    for (k=export_index[neib];k<export_index[neib+1];k++){
        kk= export_item[k];
        SendBuf[k]= VAL[kk];
    }
}
```

Copied to sending buffers

```
for (neib=0; neib<NeibPETot; neib++){
    tag= 0;

RecvBuf

import_index[0] import_index[1] import_index[2] import_index[3] import_index[4]

Summary: Parallel FEM

- Proper design of data structure of distributed local meshes.
- Open Technical Issues
 - Parallel Mesh Generation, Parallel Visualization
 - Parallel Preconditioner for Ill-Conditioned Problems
 - Large-Scale I/O

Distributed Local Data Structure for Parallel Computation

- Distributed local data structure for domain-to-domain communications has been introduced, which is appropriate for such applications with sparse coefficient matrices (e.g. FDM, FEM, FVM etc.).
 - SPMD
 - Local Numbering: Internal pts to External pts
 - Generalized communication table
- Everything is easy, if proper data structure is defined:
 - Values at boundary pts are copied into sending buffers
 - Send/Recv
 - Values at external pts are updated through receiving buffers
