Motivation for Parallel Computing (and this class)

- Large-scale parallel computer enables fast computing in large-scale scientific simulations with detailed models. Computational science develops new frontiers of science and engineering.
- Why parallel computing ?
 - faster & larger
 - “larger” is more important from the view point of “new frontiers of science & engineering”, but “faster” is also important.
 - + more complicated
 - Ideal: Scalable
 - Solving N^x scale problem using N^x computational resources during same computation time.

Scalable, Scaling, Scalability

- Solving N^x scale problem using N^x computational resources during same computation time
 - for large-scale problems: **Weak Scaling, Weak Scalability**
 - e.g. CG solver: more iterations needed for larger problems
- Solving a problem using N^x computational resources during $1/N$ computation time
 - for faster computation: **Strong Scaling, Strong Scalability**

Overview

- What is MPI ?
- Your First MPI Program: Hello World
- Collective Communication
- Point-to-Point Communication

What is MPI ? (1/2)

- Message Passing Interface
- “Specification” of message passing API for distributed memory environment
 - Not a program, Not a library
 - <http://www.mcs.anl.gov/mpi/www/>
- History
 - 1992 MPI Forum
 - 1994 MPI-1
 - 1997 MPI-2: MPI I/O
 - 2012 MPI-3: Fault Resilience, Asynchronous Collective
- Implementation
 - mpich ANL (Argonne National Laboratory), OpenMPI, MVAPICH
 - H/W vendors
 - C/C++, FOTRAN, Java ; Unix, Linux, Windows, Mac OS

What is MPI ? (2/2)

- “mpich” (free) is widely used
 - supports MPI-2 spec. (partially)
 - MPICH2 after Nov. 2005.
 - <http://www.mcs.anl.gov/mpi/>
- Why MPI is widely used as *de facto standard* ?
 - Uniform interface through MPI forum
 - Portable, can work on any types of computers
 - Can be called from Fortran, C, etc.
 - mpich
 - free, supports every architecture
- PVM (Parallel Virtual Machine) was also proposed in early 90's but not so widely used as MPI

How to learn MPI (1/2)

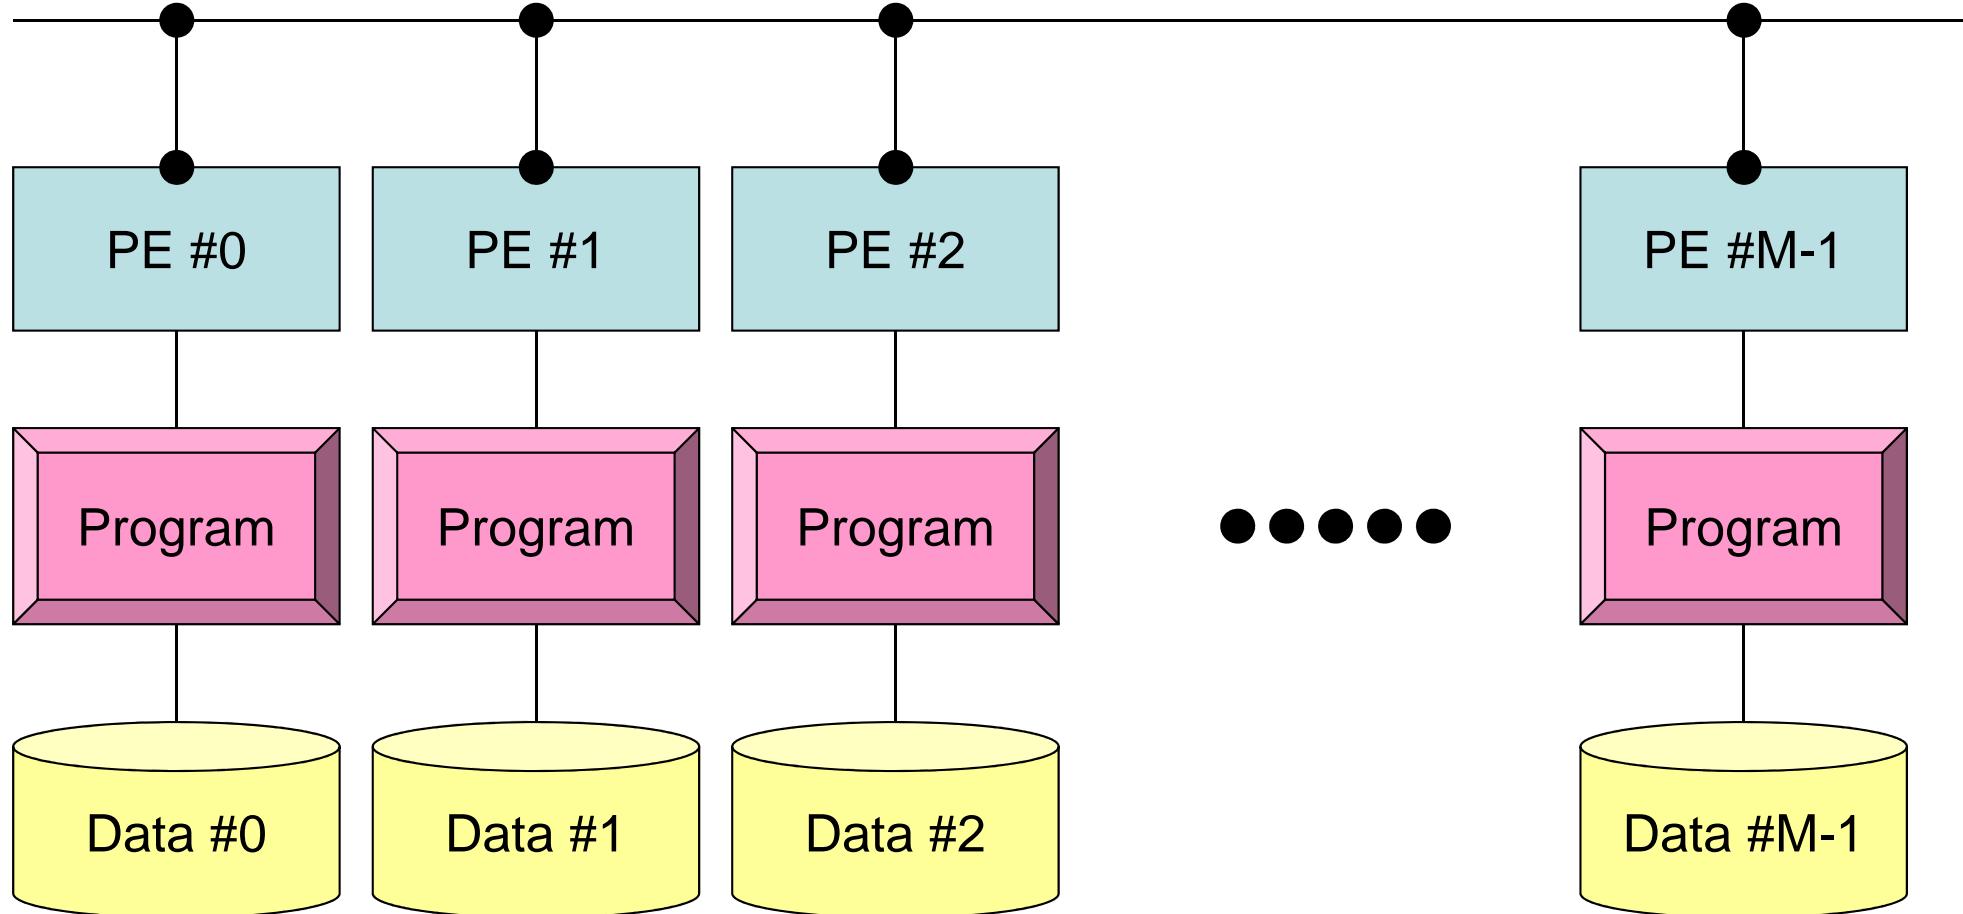

- Grammar
 - 10-20 functions of MPI-1 will be taught in the class
 - although there are many convenient capabilities in MPI-2
 - If you need further information, you can find information from web, books, and MPI experts.
- Practice is important
 - Programming
 - “Running the codes” is the most important
- Be familiar with or “grab” the idea of SPMD/SIMD op's
 - Single Program/Instruction Multiple Data
 - Each process does same operation for different data
 - Large-scale data is decomposed, and each part is computed by each process
 - Global/Local Data, Global/Local Numbering

PE: Processing Element
Processor, Domain, Process

SPMD

You understand 90% MPI, if you understand this figure.

```
mpirun -np M <Program>
```

Each process does same operation for different data

Large-scale data is decomposed, and each part is computed by each process
It is ideal that parallel program is not different from serial one except communication.

Some Technical Terms

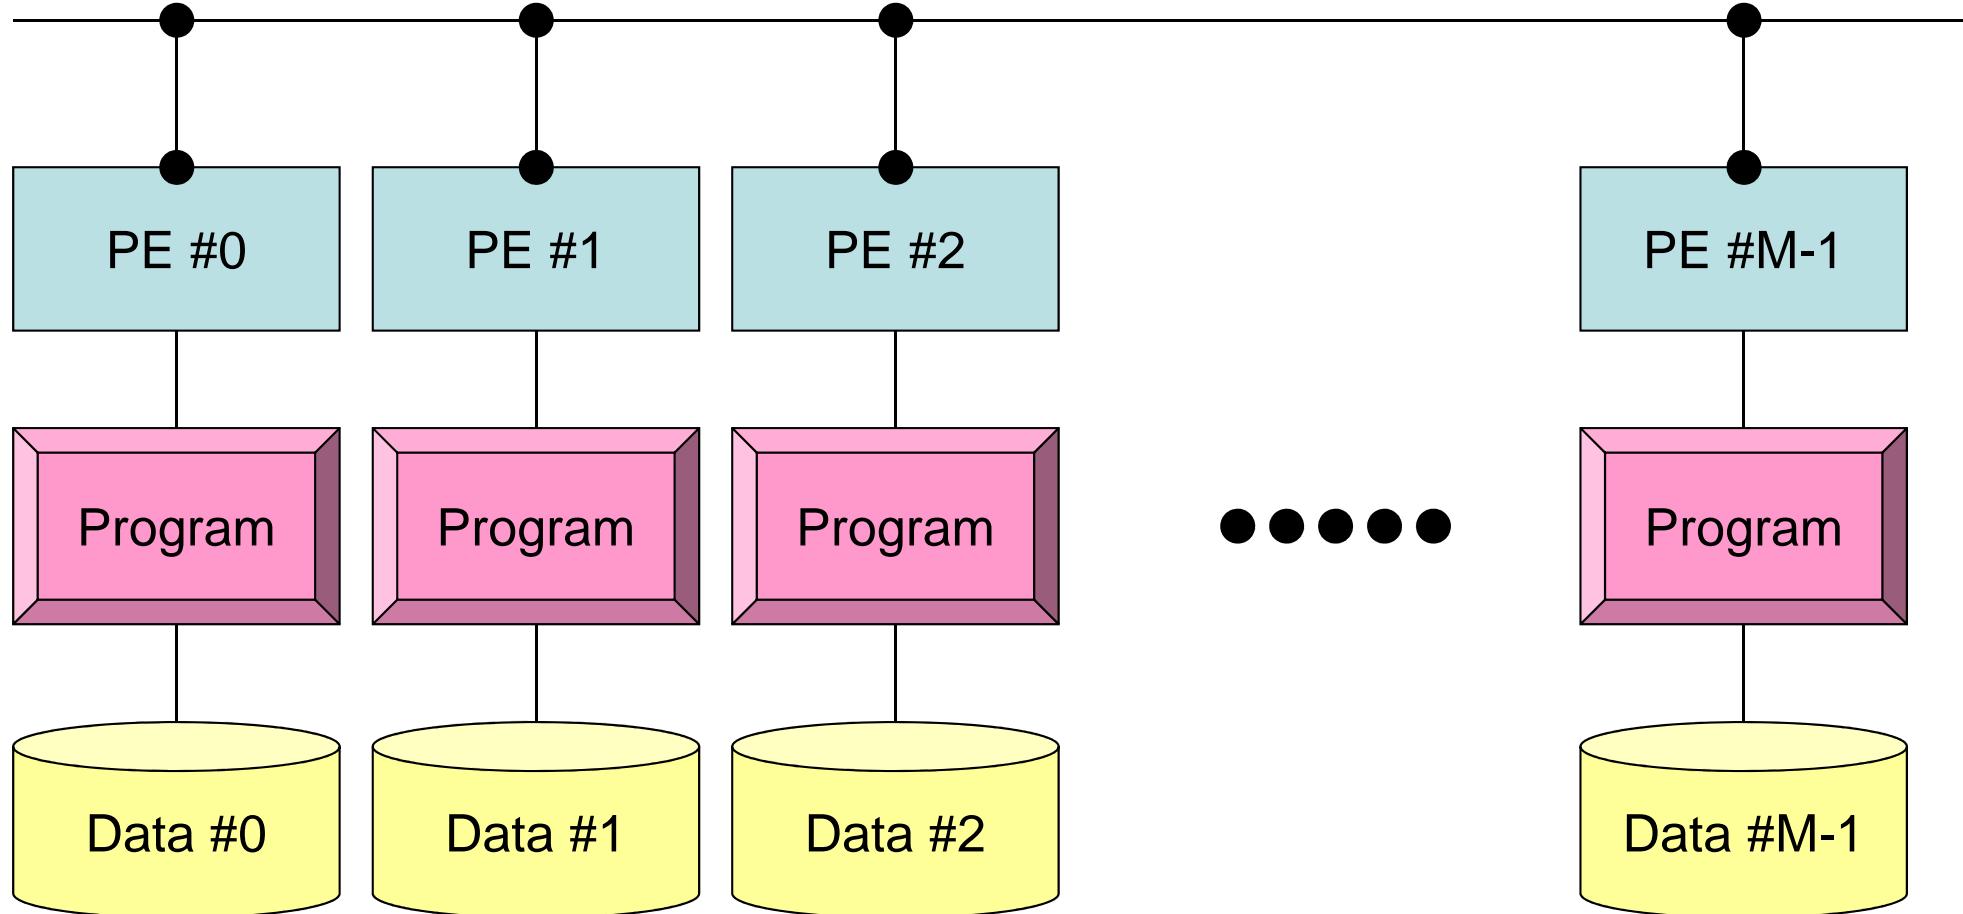

- Processor, Core
 - Processing Unit (H/W), Processor=Core for single-core proc's
- Process
 - Unit for MPI computation, nearly equal to "core"
 - Each core (or processor) can host multiple processes (but not efficient)
- PE (Processing Element)
 - PE originally mean "processor", but it is sometimes used as "process" in this class. Moreover it means "domain" (next)
 - In multicore proc's: PE generally means "core"
- Domain
 - domain=process (=PE), each of "MD" in "SPMD", each data set
- **Process ID of MPI (ID of PE, ID of domain) starts from "0"**
 - if you have 8 processes (PE's, domains), ID is 0~7

PE: Processing Element
Processor, Domain, Process

SPMD

You understand 90% MPI, if you understand this figure.

```
mpirun -np M <Program>
```

Each process does same operation for different data

Large-scale data is decomposed, and each part is computed by each process

It is ideal that parallel program is not different from serial one except communication.

How to learn MPI (2/2)

- NOT so difficult.
- Therefore, 2-3 lectures are enough for just learning grammar of MPI.
- Grab the idea of SPMD !

Schedule

- MPI
 - Basic Functions
 - Collective Communication
 - Point-to-Point (or Peer-to-Peer) Communication
- 105 min. x 3-4 lectures
 - Collective Communication
 - Report S1
 - Point-to-Point Communication
 - Report S2: Parallelization of 1D code
 - At this point, you are almost an expert of MPI programming.

- What is MPI ?
- **Your First MPI Program: Hello World**
- Collective Communication
- Point-to-Point Communication

Login to Reedbush-U

```
ssh t29**@reedbush.cc.u-tokyo.ac.jp
```

Create directory

```
>$ cd /lustre/gt29/t29XXX  
>$ mkdir pFEM (your favorite name)  
>$ cd pFEM
```

In this class this top-directory is called **<\$O-TOP>**.
Files are copied to this directory.

Under this directory, **S1**, **S2**, **S1-ref** are created:

```
<$O-S1> = <$O-TOP>/mpi/S1  
<$O-S2> = <$O-TOP>/mpi/S2
```

Reedbush-U

ECCS2016

Copying files on Reedbush-U

Fortan

```
>$ cd <$O-TOP>
>$ cp /lustre/gt29/z30088/class_eps/F/s1-f.tar .
>$ tar xvf s1-f.tar
```

C

```
>$ cd <$O-TOP>
>$ cp /lustre/gt29/z30088/class_eps/C/s1-c.tar .
>$ tar xvf s1-c.tar
```

Confirmation

```
>$ ls
mpi

>$ cd mpi/S1
```

This directory is called as <\$O-S1> .

<\$O-S1> = <\$O-TOP>/mpi/S1

First Example

hello.f

```
implicit REAL*8 (A-H,O-Z)
include 'mpif.h'
integer :: PETOT, my_rank, ierr

call MPI_INIT      (ierr)
call MPI_COMM_SIZE (MPI_COMM_WORLD, PETOT, ierr )
call MPI_COMM_RANK (MPI_COMM_WORLD, my_rank, ierr )

write (*, '(a,2i8)') 'Hello World FORTRAN', my_rank, PETOT

call MPI_FINALIZE (ierr)

stop
end
```

hello.c

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;

    MPI_Init(&argc,&argv);
    MPI_Comm_size(MPI_COMM_WORLD,&numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD,&myid);
    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

Compiling hello.f/c

```
>$ cd <$O-S1>
>$ mpiifort -O3 hello.f
>$ mpicc -O3 hello.c
```

Running Job

- Batch Jobs
 - Only batch jobs are allowed.
 - Interactive executions of jobs are not allowed.
- How to run
 - writing job script
 - submitting job
 - checking job status
 - checking results
- Utilization of computational resources
 - 1-node (36 cores) is occupied by each job.
 - Your node is not shared by other jobs.

Job Script

- <\$0-\$1>/hello.sh
- Scheduling + Shell Script

```

#!/bin/sh
#PBS -q u-lecture
#PBS -N HELLO
#PBS -l select=1:mpiprocs=4
#PBS -Wgroup_list=gt29
#PBS -l walltime=00:05:00
#PBS -e err
#PBS -o hello.lst

cd $PBS_O_WORKDIR
. /etc/profile.d/modules.sh

Job Submission

```
>$ cd <$O-$1>
>$ qsub hello.sh
```

```
>$ cat hello.lst
```

```
Hello World 0
Hello World 3
Hello World 2
Hello World 1
```

Available QUEUE's

- Following 2 queues are available.
- 8 nodes can be used
 - **u-lecture**
 - 8 nodes (288 cores), 10 min., valid until the end of March, 2017
 - Shared by all “educational” users
 - **u-lecture9**
 - 8 nodes (288 cores), 10 min., active during class time
 - More jobs (compared to **lecture**) can be processed up on availability.

Submitting & Checking Jobs

- Submitting Jobs `qsub SCRIPT NAME`
- Checking status of jobs `rbstat`
- Deleting/aborting `qdel JOB ID`
- Checking status of queues `rbstat --rsc`
- Detailed info. of queues `rbstat --rsc -x`
- Number of running jobs `rbstat -b`
- History of Submission `rbstat -H`
- Limitation of submission `rbstat --limit`

Basic/Essential Functions

```

    MPI_Comm_rank(MPI_COMM_WORLD, &myid);

    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}

```

'mpif.h', **"mpi.h"**
 Essential Include file
 "use mpi" is possible in F90

MPI_Init
 Initialization

MPI_Comm_size
 Number of MPI Processes
 mpirun -np XX <prog>

MPI_Comm_rank
 Process ID starting from 0

MPI_Finalize
 Termination of MPI processes

Difference between FORTRAN/C

- (Basically) same interface
 - In C, UPPER/lower cases are considered as different
 - e.g.: **MPI_Comm_size**
 - MPI: UPPER case
 - First character of the function except “MPI_” is in UPPER case.
 - Other characters are in lower case.
- In Fortran, return value `ierr` has to be added at the end of the argument list.
- C needs special types for variables:
 - `MPI_Comm`, `MPI_Datatype`, `MPI_Op` etc.
- **MPI_INIT** is different:
 - `call MPI_INIT (ierr)`
 - `MPI_Init (int *argc, char ***argv)`

What's are going on ?

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;
    MPI_Init(&argc, &argv);
    MPI_Comm_size(MPI_COMM_WORLD, &numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD, &myid);
    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

```
#!/bin/sh
#PBS -q u-lecture
#PBS -N HELLO
#PBS -l select=1:mpiprocs=4
#PBS -Wgroup_list=gt29
#PBS -l walltime=00:05:00
#PBS -e err
#PBS -o hello.lst

cd $PBS_O_WORKDIR
. /etc/profile.d/modules.sh
export I_MPI_PIN_DOMAIN=socket
mpirun ./impimap.sh ./a.out
```

(ESSENTIAL)
Execution on each socket
Exec's

- **mpirun** starts up 4 MPI processes ("proc=4")
 - A single program runs on four processes.
 - each process writes a value of **myid**
- Four processes do same operations, but values of **myid** are different.
- Output of each process is different.
- **That is SPMD !**

mpi.h, mpif.h

```
implicit REAL*8 (A-H,O-Z)
include 'mpif.h'
integer :: PETOT, my_rank, ierr

call MPI_INIT      (ierr)
call MPI_COMM_SIZE (MPI_COMM_WORLD, PETOT, ierr )
call MPI_COMM_RANK (MPI_COMM_WORLD, my_rank, ierr )

write (*, '(a,2i8)') 'Hello World FORTRAN', my_rank, PETOT

call MPI_FINALIZE (ierr)

stop
end
```

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;

    MPI_Init(&argc,&argv);
    MPI_Comm_size(MPI_COMM_WORLD, &numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD, &myid);

    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

- Various types of parameters and variables for MPI & their initial values.
- Name of each var. starts from “MPI_”
- Values of these parameters and variables cannot be changed by users.
- Users do not specify variables starting from “MPI_” in users’ programs.

MPI_Init

- Initialize the MPI execution environment (required)
- It is recommended to put this BEFORE all statements in the program.
- **MPI_Init (argc, argv)**

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;

    MPI_Init(&argc, &argv);
    MPI_Comm_size(MPI_COMM_WORLD, &numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD, &myid);

    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

MPI_Finalize

- Terminates MPI execution environment (required)
 - It is recommended to put this AFTER all statements in the program.
 - Please do not forget this.
-
- **MPI_Finalize ()**

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;

    MPI_Init(&argc, &argv);
    MPI_Comm_size(MPI_COMM_WORLD, &numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD, &myid);

    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

MPI_Comm_size

- Determines the size of the group associated with a communicator
- not required, but very convenient function
- **MPI_Comm_size (comm, size)**
 - **comm** MPI_Comm I communicator
 - **size** int O number of processes in the group of communicator

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;

    MPI_Init(&argc, &argv);
    MPI_Comm_size(MPI_COMM_WORLD, &numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD, &myid);

    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

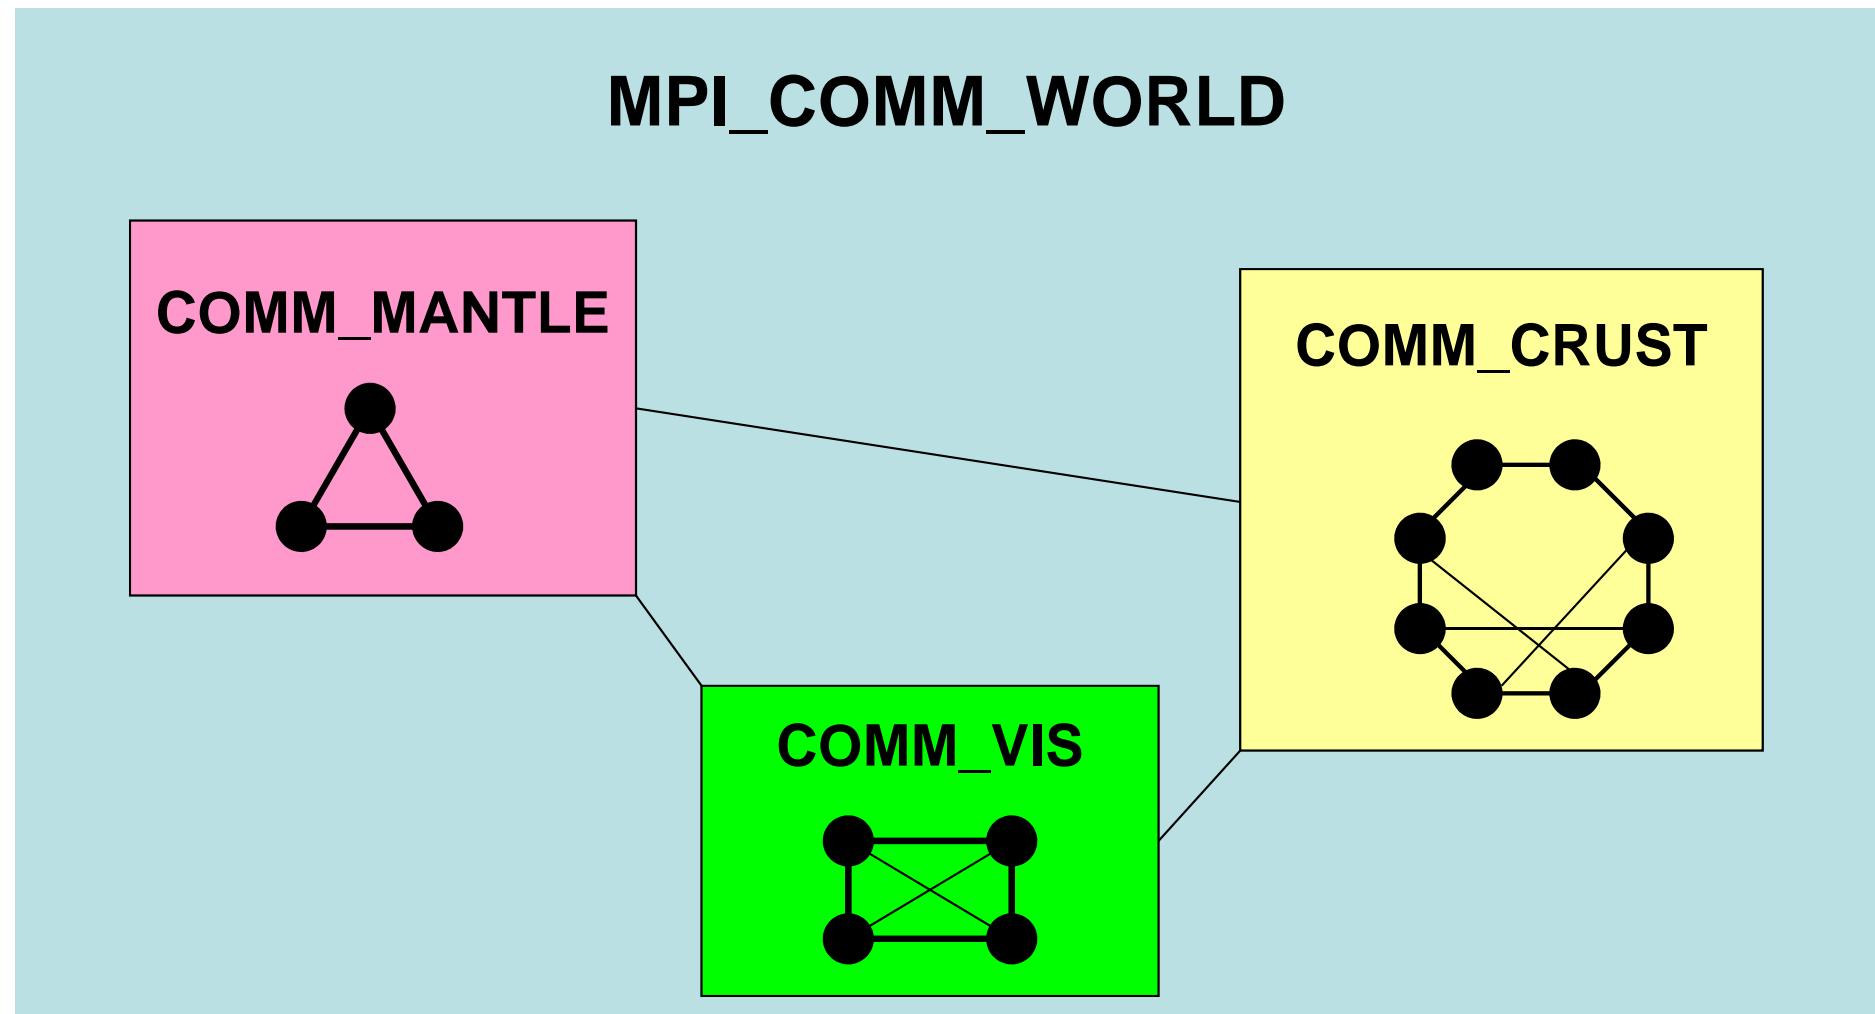

What is Communicator ?

MPI_Comm_Size (MPI_COMM_WORLD, PETOT)

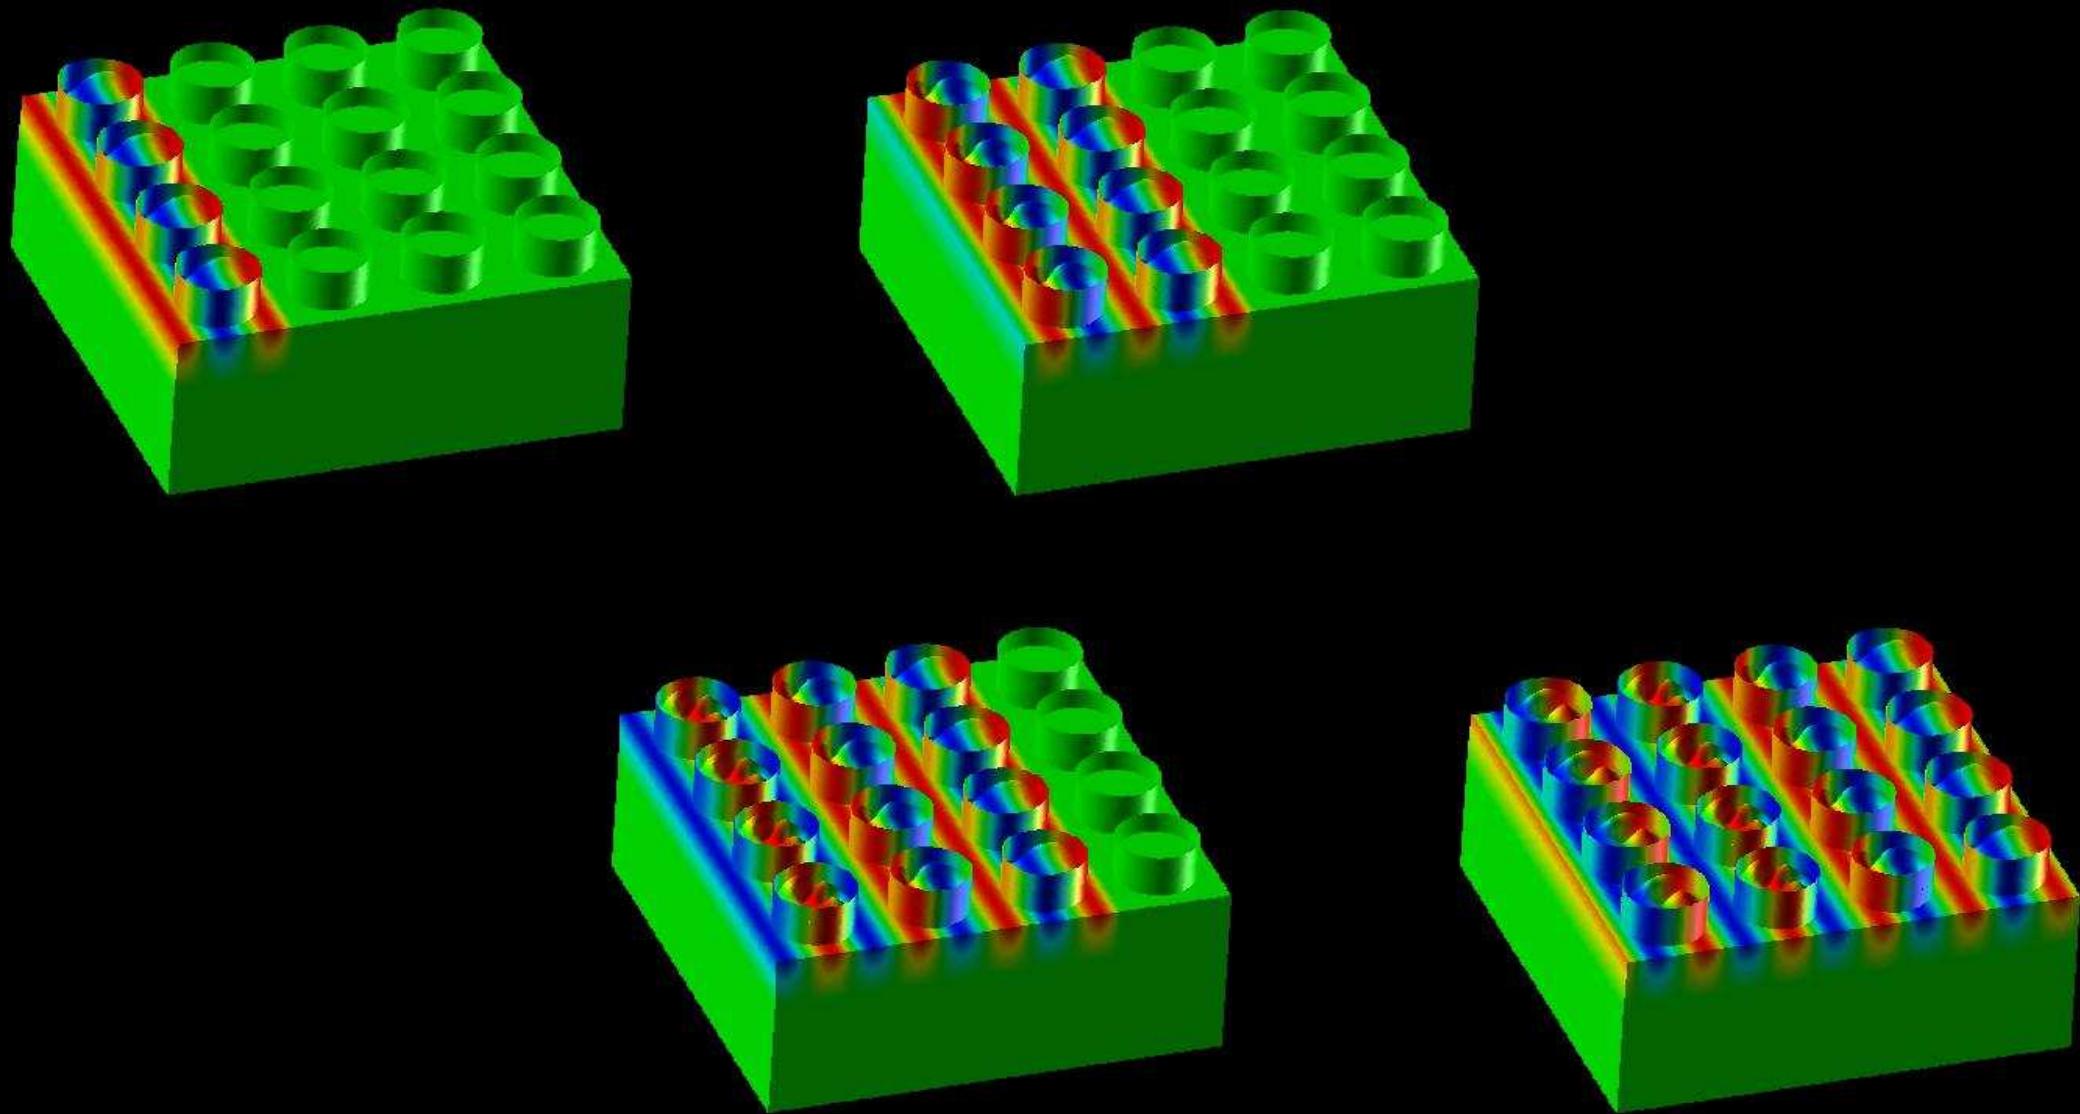

- Group of processes for communication
- Communicator must be specified in MPI program as a unit of communication
- All processes belong to a group, named “**MPI_COMM_WORLD**” (default)
- Multiple communicators can be created, and complicated operations are possible.
 - Computation, Visualization
- Only “**MPI_COMM_WORLD**” is needed in this class.

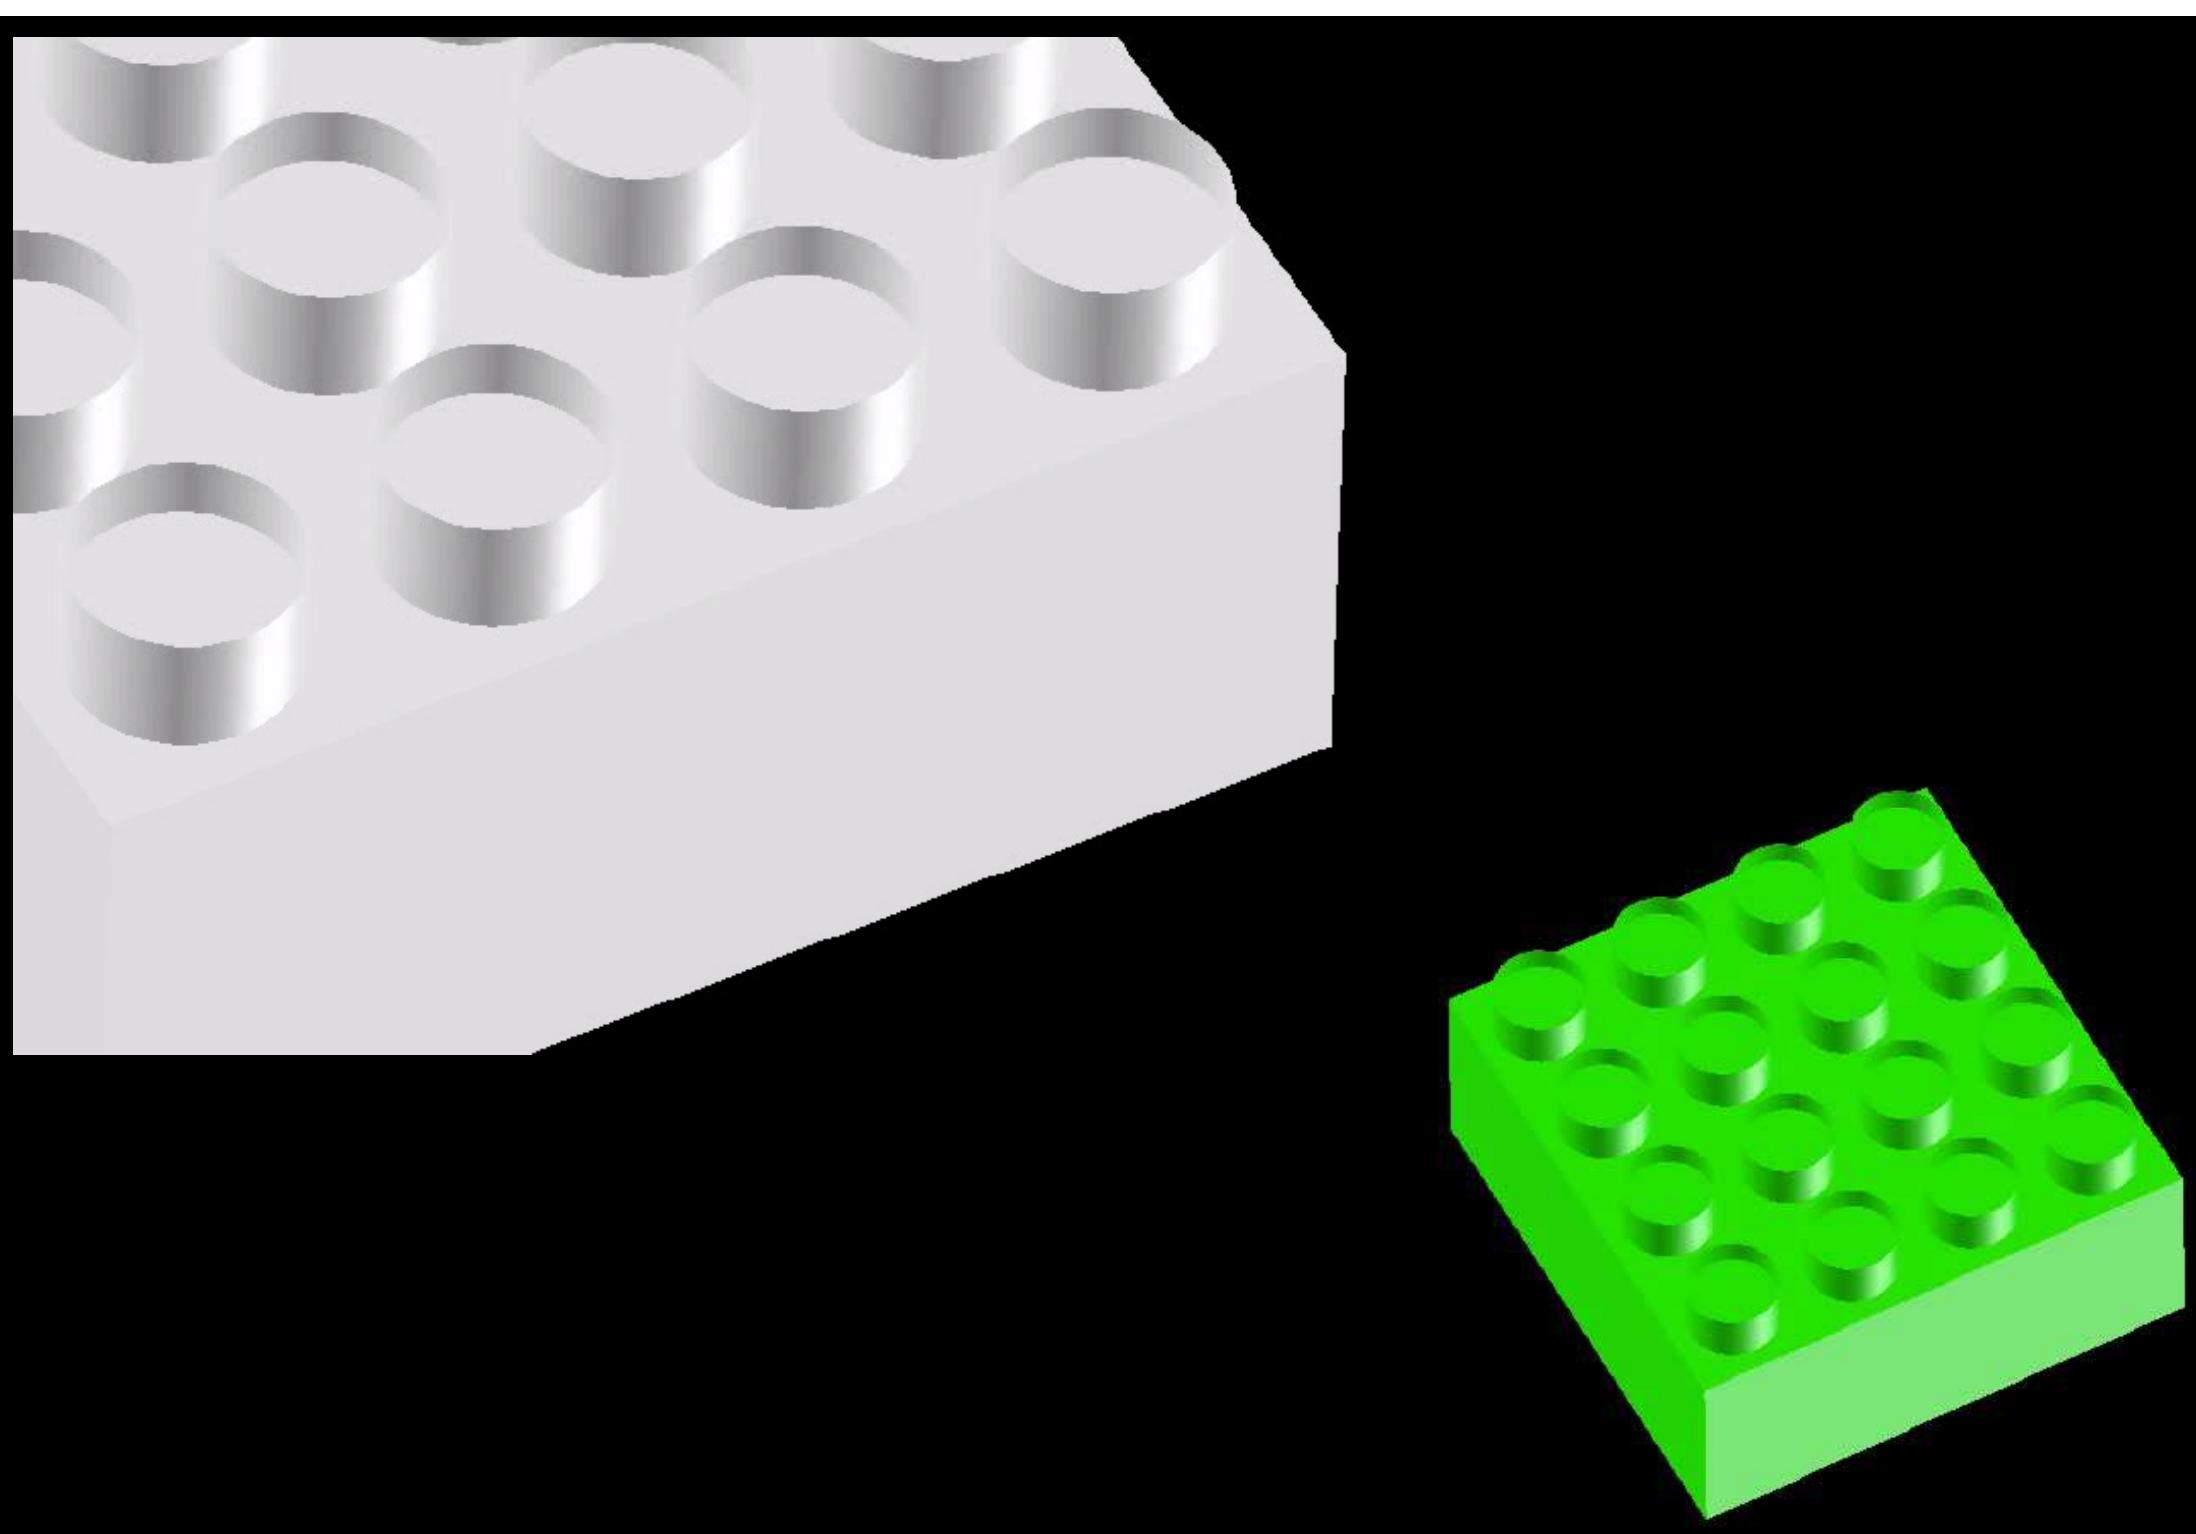

Communicator in MPI

One process can belong to multiple communicators

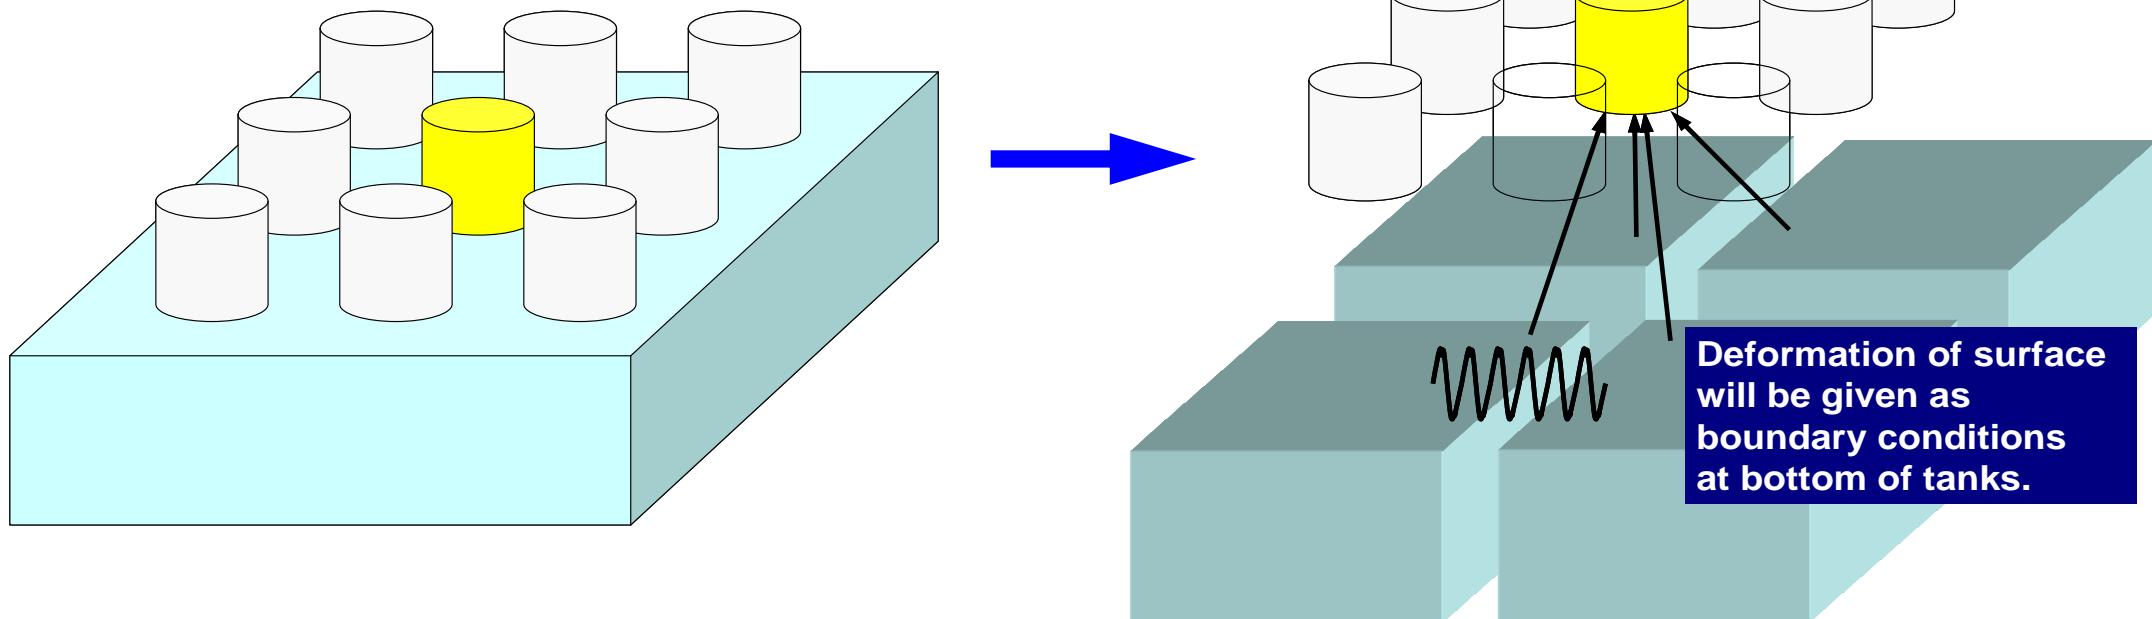

Coupling between “Ground Motion” and “Sloshing of Tanks for Oil-Storage”

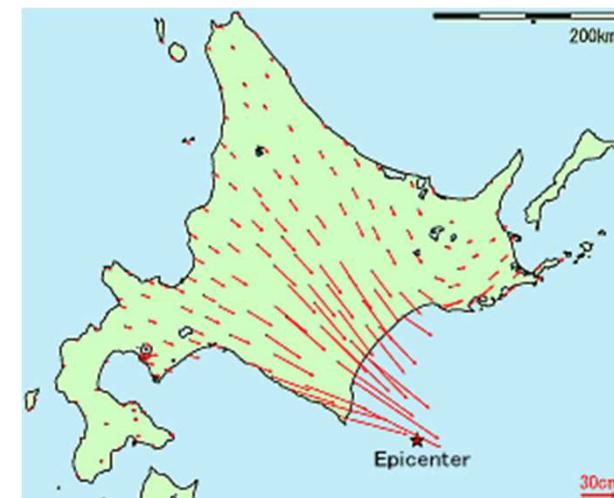

Target Application

- Coupling between “Ground Motion” and “Sloshing of Tanks for Oil-Storage”
 - “One-way” coupling from “Ground Motion” to “Tanks”.
 - Displacement of ground surface is given as forced displacement of bottom surface of tanks.
 - 1 Tank = 1 PE (serial)

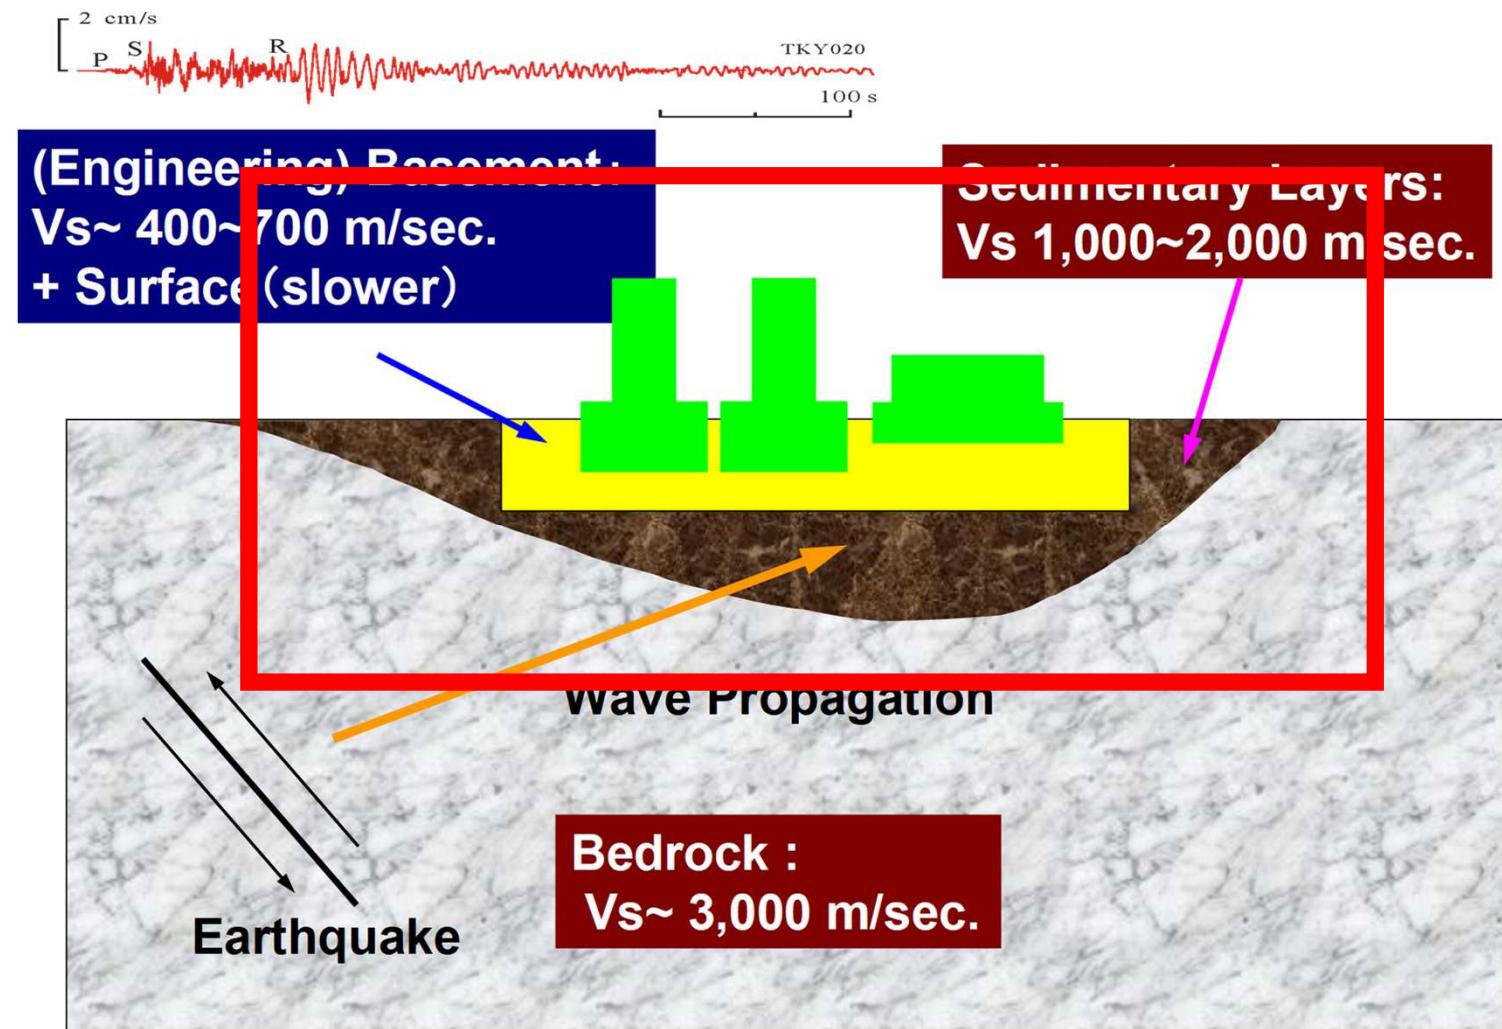

2003 Tokachi Earthquake (M8.0)

Fire accident of oil tanks due to long period ground motion (surface waves) developed in the basin of Tomakomai

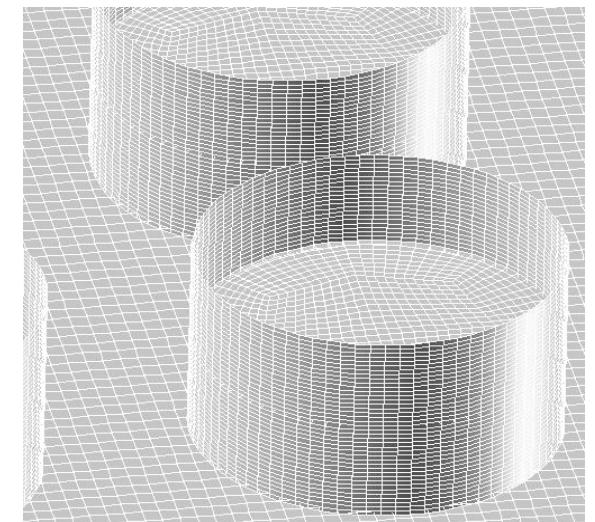

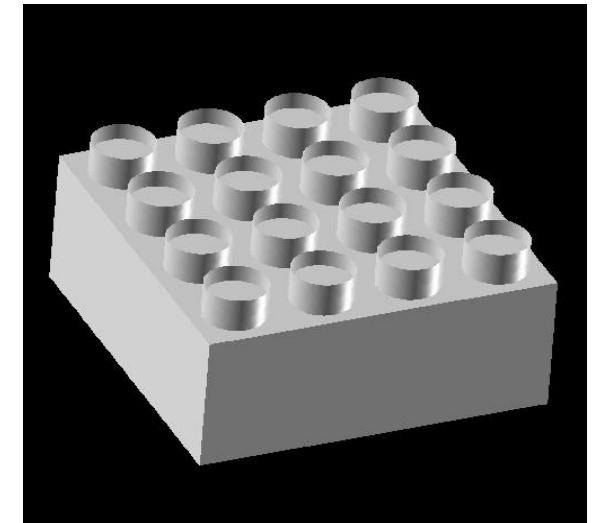

Seismic Wave Propagation, Underground Structure

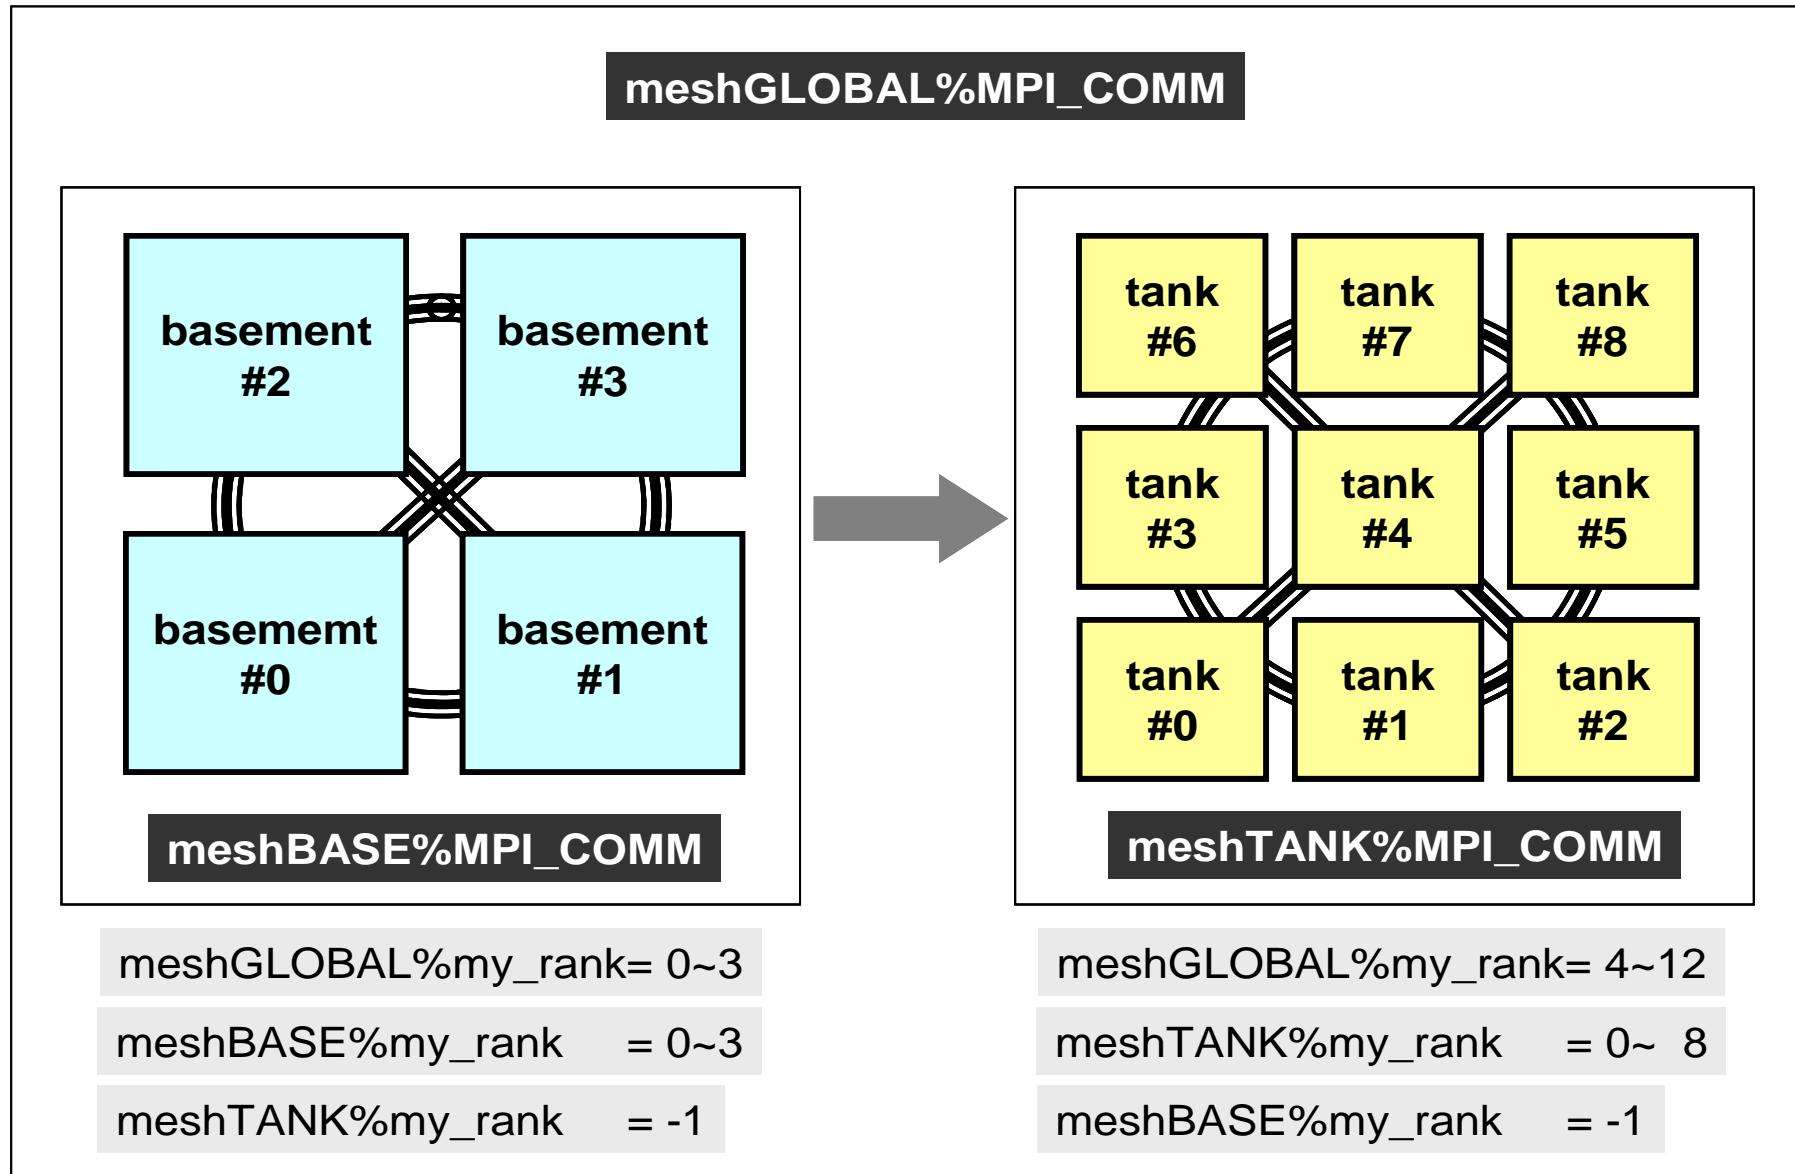

Simulation Codes

- Ground Motion (Ichimura): Fortran
 - Parallel FEM, 3D Elastic/Dynamic
 - Explicit forward Euler scheme
 - Each element: $2\text{m} \times 2\text{m} \times 2\text{m}$ cube
 - $240\text{m} \times 240\text{m} \times 100\text{m}$ region
- Sloshing of Tanks (Nagashima): C
 - Serial FEM (Embarrassingly Parallel)
 - Implicit backward Euler, Skyline method
 - Shell elements + Inviscid potential flow
 - D: 42.7m, H: 24.9m, T: 20mm,
 - Frequency: 7.6sec.
 - 80 elements in circ., 0.6m mesh in height
 - Tank-to-Tank: 60m, 4×4
- Total number of unknowns: 2,918,169

Three Communicators

MPI_Comm_rank

- Determines the rank of the calling process in the communicator
 - “ID of MPI process” is sometimes called “rank”
- **MPI_Comm_rank (comm, rank)**
 - comm MPI_Comm I communicator
 - rank int O rank of the calling process in the group of comm
Starting from “0”

```
#include "mpi.h"
#include <stdio.h>
int main(int argc, char **argv)
{
    int n, myid, numprocs, i;

    MPI_Init(&argc, &argv);
    MPI_Comm_size(MPI_COMM_WORLD, &numprocs);
    MPI_Comm_rank(MPI_COMM_WORLD, &myid);

    printf ("Hello World %d\n", myid);
    MPI_Finalize();
}
```

MPI_Abort

- Aborts MPI execution environment
- **MPI_Abort (comm, errcode)**
 - **comm** MPI_Comm I communicator
 - **errcode** int O error code

MPI_Wtime

- Returns an elapsed time on the calling processor
- **time= MPI_Wtime ()**
 - **time** double 0 Time in seconds since an arbitrary time in the past.

```
...
double Stime, Etime;

Stime= MPI_Wtime ();

(...)

Etime= MPI_Wtime ();
```

Example of MPI_Wtime

```
$> cd <$O-S1>  
  
$> mpicc -O1 time.c  
$> mpiifort -O1 time.f  
  
(modify go4.sh, 4 processes)  
$> qsub go4.sh
```

0	1.113281E+00
3	1.113281E+00
2	1.117188E+00
1	1.117188E+00

Process ID	Time
------------	------

MPI_Wtick

- Returns the resolution of MPI_Wtime
- depends on hardware, and compiler
- **time= MPI_Wtick ()**
 - time double 0 Time in seconds of resolution of MPI_Wtime

```
implicit REAL*8 (A-H,O-Z)
include 'mpif.h'

...
TM= MPI_WTICK ()
write (*,*) TM
...
```

```
double Time;

...
Time = MPI_Wtick();
printf("%5d%16.6E\n", MyRank, Time);
...
```

Example of MPI_Wtick

```
$> cd <$O-S1>  
  
$> mpicc -O1 wtick.c  
$> mpiifort -O1 wtick.f  
  
(modify go1.sh, 1 process)  
$> qsub go1.sh
```

MPI_Barrier

- Blocks until all processes in the communicator have reached this routine.
- Mainly for debugging, huge overhead, not recommended for real code.
- **`MPI_Barrier (comm)`**
 - **`comm`** `MPI_Comm` I communicator

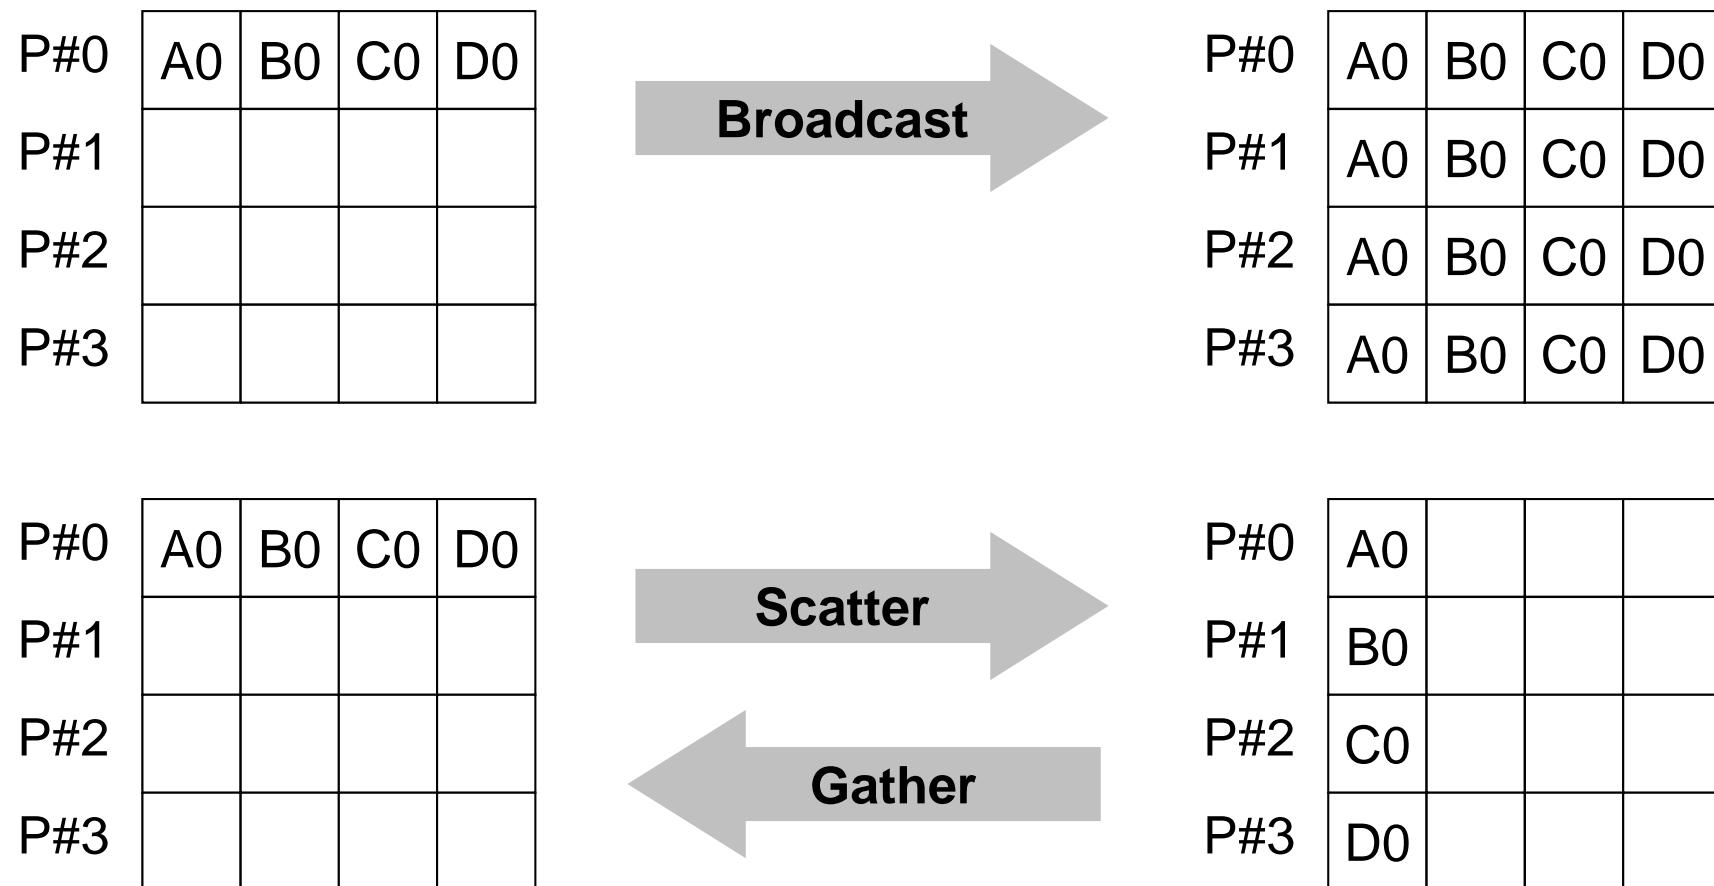

- What is MPI ?
- Your First MPI Program: Hello World
- **Collective Communication**
- Point-to-Point Communication

What is Collective Communication ?

集団通信, グループ通信

- Collective communication is the process of exchanging information between multiple MPI processes in the communicator: one-to-all or all-to-all communications.
- Examples
 - Broadcasting control data
 - Max, Min
 - Summation
 - Dot products of vectors
 - Transformation of dense matrices

Examples by Collective Comm.

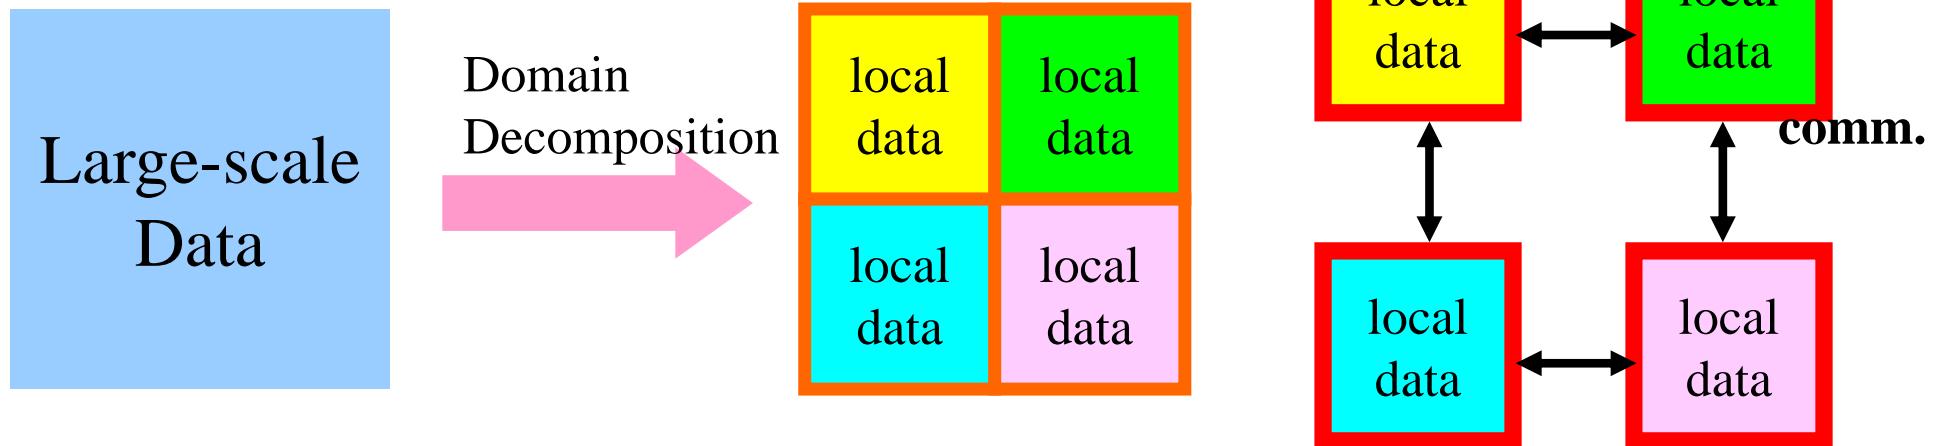

- Dot Products of Vectors
- Reading Distributed Files

Global/Local Data

- Data structure of parallel computing based on SPMD, where large scale “global data” is decomposed to small pieces of “local data”.

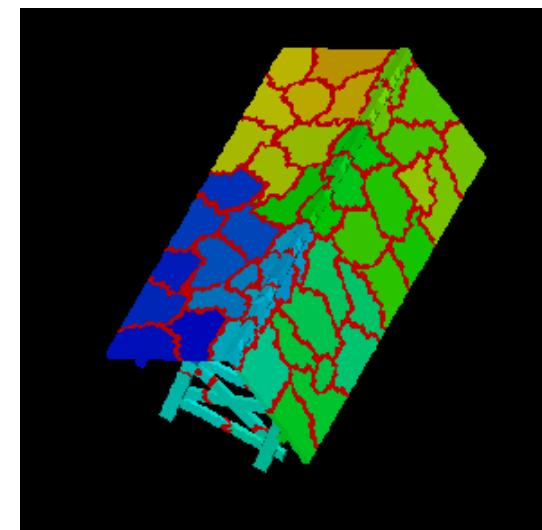

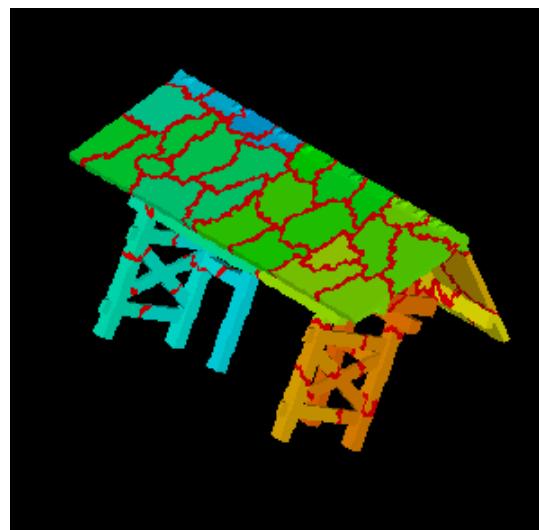

Domain Decomposition/Partitioning

- PC with 1GB RAM: can execute FEM application with up to 10^6 meshes
 - $10^3\text{km} \times 10^3\text{ km} \times 10^2\text{ km}$ (SW Japan): 10^8 meshes by 1km cubes
- Large-scale Data: Domain decomposition, parallel & local operations
- Global Computation: Comm. among domains needed

Local Data Structure

- It is important to define proper local data structure for target computation (and its algorithm)
 - Algorithms= Data Structures
- Main objective of this class !

Global/Local Data

- Data structure of parallel computing based on SPMD, where large scale “global data” is decomposed to small pieces of “local data”.
- Consider the dot product of following VECp and VECs with length=20 by parallel computation using 4 processors

VECp	[0] =	2
	[1] =	2
	[2] =	2
...		
	[17] =	2
	[18] =	2
	[19] =	2

MPI_Reduce

- Reduces values on all processes to a single value
 - Summation, Product, Max, Min etc.
- `MPI_Reduce (sendbuf, recvbuf, count, datatype, op, root, comm)`**
 - sendbuf** choice I starting address of send buffer
 - recvbuf** choice O starting address receive buffer
type is defined by "datatype"
 - count** int I number of elements in send/receive buffer
 - datatype** MPI_Datatype I data type of elements of send/receive buffer
 - FORTRAN MPI_INTEGER, MPI_REAL, MPI_DOUBLE_PRECISION, MPI_CHARACTER etc.
 - C MPI_INT, MPI_FLOAT, MPI_DOUBLE, MPI_CHAR etc
 - op** MPI_Op I reduce operation
 - MPI_MAX, MPI_MIN, MPI_SUM, MPI_PROD, MPI_LAND, MPI_BAND etc*Users can define operations by [MPI_OP_CREATE](#)*
 - root** int I rank of root process
 - comm** MPI_Comm I communicator

Send/Receive Buffer (Sending/Receiving)

- Arrays of “send (sending) buffer” and “receive (receiving) buffer” often appear in MPI.
- Addresses of “send (sending) buffer” and “receive (receiving) buffer” must be different.

Send/Receive Buffer (1/3)

A: Scalar

```
call MPI_REDUCE  
(A, recvbuf, 1, datatype, op, root, comm, ierr)
```

```
MPI_Reduce  
(A, recvbuf, 1, datatype, op, root, comm)
```

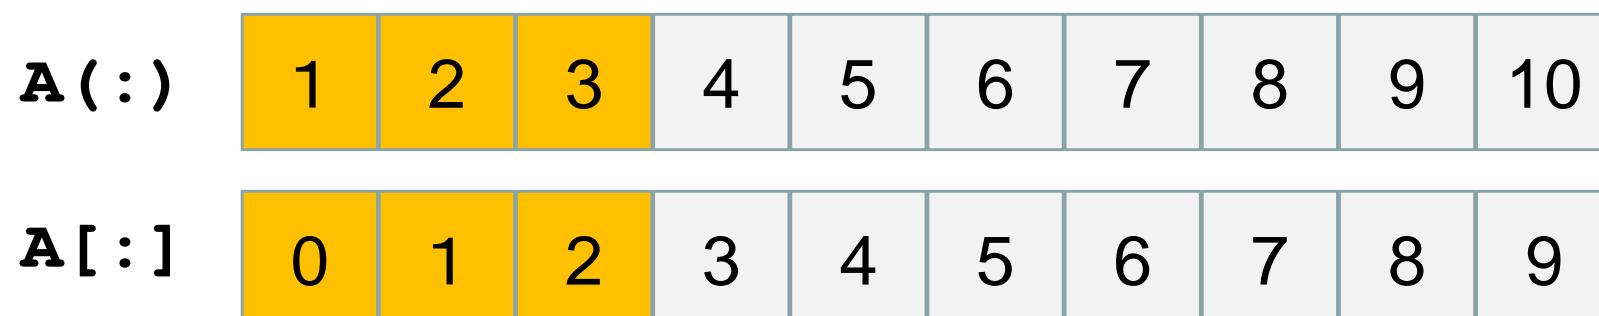

Send/Receive Buffer (2/3)

A: Array

```
call MPI_REDUCE  
(A, recvbuf, 3, datatype, op, root, comm, ierr)
```

```
MPI_Reduce  
(A, recvbuf, 3, datatype, op, root, comm)
```

- Starting Address of Send Buffer
 - A (1): Fortran, A [0]: C
 - 3 (continuous) components of A (A (1)–A (3), A [0]–A [2]) are sent

Send/Receive Buffer (3/3)

A: Array

```
call MPI_REDUCE  
(A(4), recvbuf, 3, datatype, op, root, comm, ierr)
```

```
MPI_Reduce  
(A[3], recvbuf, 3, datatype, op, root, comm)
```

- Starting Address of Send Buffer
 - A (4): Fortran, A [3]: C
 - 3 (continuous) components of A (A (4)–A (6), A [3]–A [5]) are sent

A(:)	1	2	3	4	5	6	7	8	9	10
------	---	---	---	---	---	---	---	---	---	----

A[:]	0	1	2	3	4	5	6	7	8	9
------	---	---	---	---	---	---	---	---	---	---

Example of MPI_Reduce (1/2)

MPI_Reduce

(sendbuf, recvbuf, count, datatype, op, root, comm)

```
double x0, x1;  
  
MPI_Reduce  
(&x0, &x1, 1, MPI_DOUBLE, MPI_MAX, 0, <comm>);
```

```
double x0[4], xmax[4];  
  
MPI_Reduce  
(x0, xmax, 4, MPI_DOUBLE, MPI_MAX, 0, <comm>);
```

Global Max values of X0[i] go to XMAX[i] on #0 process (i=0~3)

Example of MPI_Reduce (2/2)

MPI_Reduce

(sendbuf, recvbuf, count, datatype, op, root, comm)

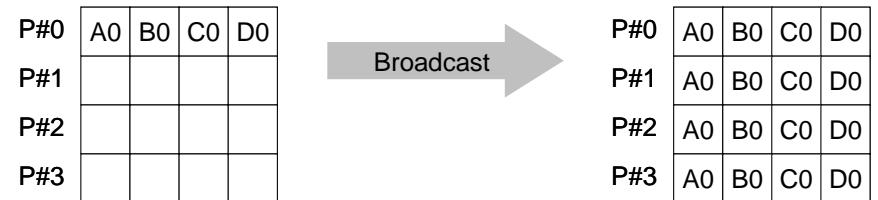

```
double X0, XSUM;  
  
MPI_Reduce  
(&X0, &XSUM, 1, MPI_DOUBLE, MPI_SUM, 0, <comm>)
```

Global summation of X0 goes to XSUM on #0 process.

```
double X0[4];  
  
MPI_Reduce  
(&X0[0], &X0[2], 2, MPI_DOUBLE_PRECISION, MPI_SUM, 0, <comm>)
```

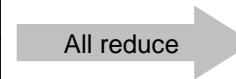

- Global summation of X0[0] goes to X0[2] on #0 process.
- Global summation of X0[1] goes to X0[3] on #0 process.

MPI_Bcast

- Broadcasts a message from the process with rank "root" to all other processes of the communicator
- **`MPI_Bcast (buffer, count, datatype, root, comm)`**
 - **buffer** choice I/O starting address of buffer
type is defined by "datatype"
 - **count** int I number of elements in send/recv buffer
 - **datatype** MPI_Datatype I data type of elements of send/recv buffer
 - FORTAN MPI_INTEGER, MPI_REAL, MPI_DOUBLE_PRECISION, MPI_CHARACTER etc.
 - C MPI_INT, MPI_FLOAT, MPI_DOUBLE, MPI_CHAR etc.
 - **root** int I **rank of root process**
 - **comm** MPI_Comm I communicator

MPI_Allreduce

P#0	A0	B0	C0	D0		P#0	op.A0-A3	op.B0-B3	op.C0-C3	op.D0-D3
P#1	A1	B1	C1	D1	All reduce	P#1	op.A0-A3	op.B0-B3	op.C0-C3	op.D0-D3
P#2	A2	B2	C2	D2		P#2	op.A0-A3	op.B0-B3	op.C0-C3	op.D0-D3
P#3	A3	B3	C3	D3		P#3	op.A0-A3	op.B0-B3	op.C0-C3	op.D0-D3

- MPI_Reduce + MPI_Bcast
- Summation (of dot products) and MAX/MIN values are likely to utilized in each process
- **call MPI_Allreduce**
(sendbuf, recvbuf, count, datatype, op, comm)
 - **sendbuf** choice I starting address of send buffer
 - **recvbuf** choice O starting address receive buffer
type is defined by "datatype"
 - **count** int I number of elements in send/recv buffer
 - **datatype** MPI_Datatype I data type of elements of send/recv buffer
 - **op** MPI_Op I reduce operation
 - **comm** MPI_Comm I communicator

“op” of MPI_Reduce/Allreduce

MPI_Reduce

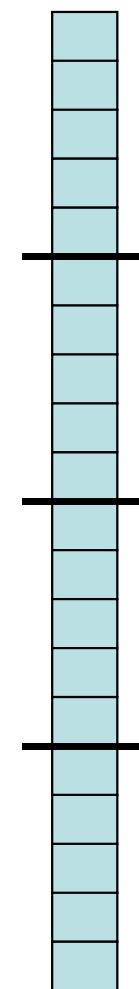

```
(sendbuf, recvbuf, count, datatype, op, root, comm)
```

- **MPI_MAX**, **MPI_MIN** Max, Min
- **MPI_SUM**, **MPI_PROD** Summation, Product
- **MPI LAND** Logical AND

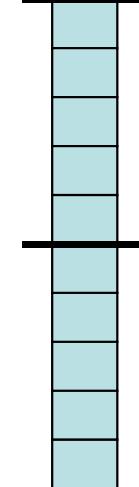

Local Data (1/2)

- Decompose vector with length=20 into 4 domains (processes)
- Each process handles a vector with length= 5

```
VECP [ 0 ] = 2  
[ 1 ] = 2  
[ 2 ] = 2  
...  
[17] = 2  
[18] = 2  
[19] = 2
```

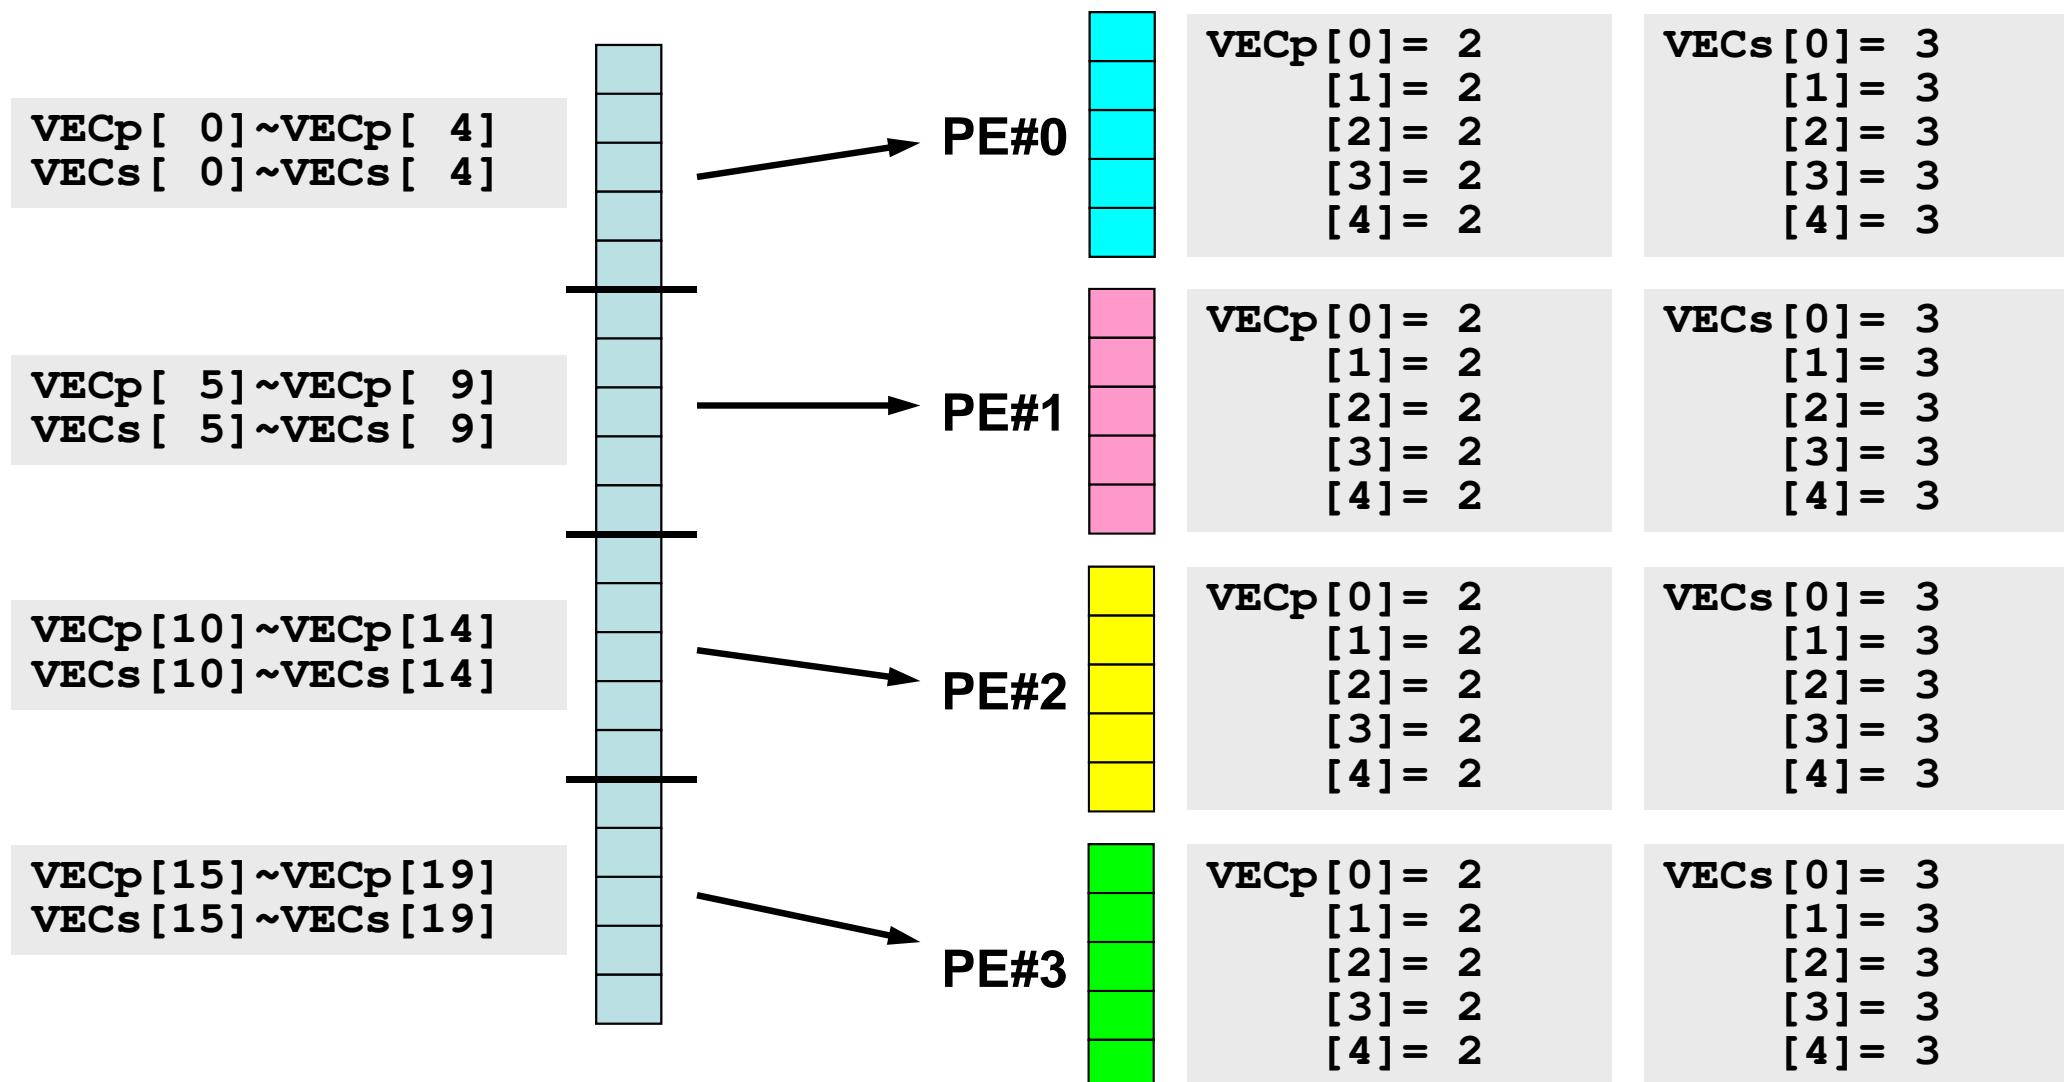

```
VECS [ 0 ] = 3  
[ 1 ] = 3  
[ 2 ] = 3  
...  
[17] = 3  
[18] = 3  
[19] = 3
```

C

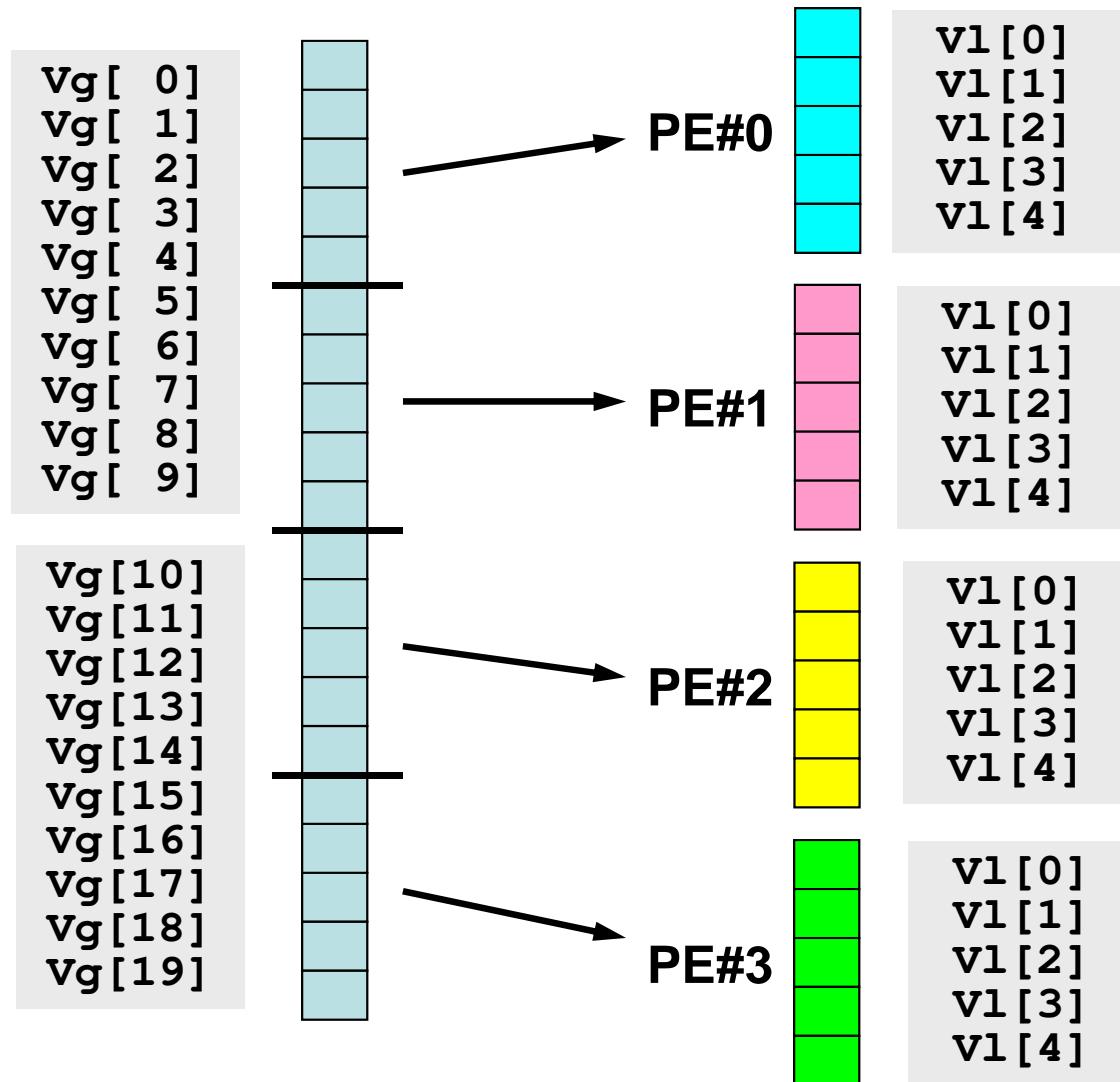

Local Data (2/2)

- 1th-5th components of original global vector go to 1th-5th components of PE#0, 6th-10th -> PE#1, 11th-15th -> PE#2, 16th-20th -> PE#3.

But ...

- It is too easy !! Just decomposing and renumbering from 1 (or 0).
- Of course, this is not enough. Further examples will be shown in the latter part.

Example: Dot Product (1/3)

<\$O-S1>/allreduce.c

```
#include <stdio.h>
#include <stdlib.h>
#include "mpi.h"

int main(int argc, char **argv) {
    int i,N;
    int PeTot, MyRank;
double VECp[5], VECs[5];
    double sumA, sumR, sum0;

    MPI_Init(&argc, &argv);
    MPI_Comm_size(MPI_COMM_WORLD, &PeTot);
    MPI_Comm_rank(MPI_COMM_WORLD, &MyRank);

    sumA= 0.0;
    sumR= 0.0;

N=5;
for(i=0;i<N;i++){
    VECp[i] = 2.0;
    VECs[i] = 3.0;
}

    sum0 = 0.0;
    for(i=0;i<N;i++) {
        sum0 += VECp[i] * VECs[i];
    }
}
```

Local vector is generated at each local process.

Example: Dot Product (2/3)

<\$O-S1>/allreduce.c

```
MPI_Reduce(&sum0, &sumR, 1, MPI_DOUBLE, MPI_SUM, 0, MPI_COMM_WORLD);
MPI_Allreduce(&sum0, &sumA, 1, MPI_DOUBLE, MPI_SUM, MPI_COMM_WORLD);
printf("before BCAST %5d %15.0F %15.0F\n", MyRank, sumA, sumR);

MPI_Bcast(&sumR, 1, MPI_DOUBLE, 0, MPI_COMM_WORLD);
printf("after BCAST %5d %15.0F %15.0F\n", MyRank, sumA, sumR);

MPI_Finalize();

return 0;
}
```

Example: Dot Product (3/3)

`<$O-S1>/allreduce.c`

```
MPI_Reduce(&sum0, &sumR, 1, MPI_DOUBLE, MPI_SUM, 0, MPI_COMM_WORLD);  
MPI_Allreduce(&sum0, &sumA, 1, MPI_DOUBLE, MPI_SUM, MPI_COMM_WORLD);
```

Dot Product

Summation of results of each process (sum0)
“sumR” has value only on PE#0.

“sumA” has value on all processes by MPI_Allreduce

```
MPI_Bcast(&sumR, 1, MPI_DOUBLE, 0, MPI_COMM_WORLD);
```

“sumR” has value on PE#1-#3 by MPI_Bcast

Execute <\$O-S1>/allreduce.f/c

```
$> mpicc -O3 allreduce.c  
$> mpiifort -O3 allreduce.f  
(modify go4.sh, 4 process)  
$> qsub go4.sh
```

- Reading Distributed Files

Operations of Distributed Local Files

- In Scatter/Gather example, PE#0 reads global data, that is *scattered* to each processor, then parallel operations are done.
- If the problem size is very large, a single processor may not read entire global data.
 - If the entire global data is decomposed to distributed local data sets, each process can read the local data.
 - If global operations are needed to a certain sets of vectors, MPI functions, such as MPI_Gather etc. are available.

How to generate local data

- Reading global data ($N=NG$)
 - Scattering to each process
 - Parallel processing on each process
 - (If needed) reconstruction of global data by gathering local data
- Generating local data ($N=NL$), or reading distributed local data
 - Generating or reading local data on each process
 - Parallel processing on each process
 - (If needed) reconstruction of global data by gathering local data
- In future, latter case is more important, but former case is also introduced in this class for understanding of operations of global/local data.

Method for PtoP Comm.

- **MPI_Send, MPI_Recv**
- These are “blocking” functions. “Dead lock” occurs for these “blocking” functions.
- A “blocking” MPI call means that the program execution will be suspended until the message buffer is safe to use.
- The MPI standards specify that a blocking SEND or RECV does not return until the send buffer is safe to reuse (for MPI_Send), or the receive buffer is ready to use (for MPI_Recv).
 - Blocking comm. confirms “secure” communication, but it is very inconvenient.
- Please just remember that “there are such functions”.

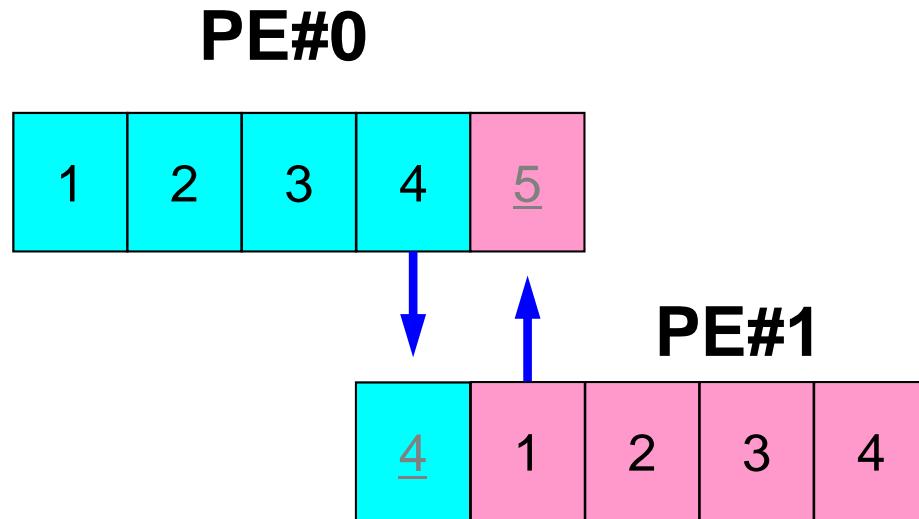

MPI_Send/MPI_Recv

```
if (my_rank.eq.0) NEIB_ID=1  
if (my_rank.eq.1) NEIB_ID=0  
  
...  
call MPI_SEND (NEIB_ID, arg's)  
call MPI_RECV (NEIB_ID, arg's)  
...
```

- This seems reasonable, but it stops at MPI_Send/MPI_Recv.
 - Sometimes it works (according to implementation).

MPI_Send/MPI_Recv (cont.)

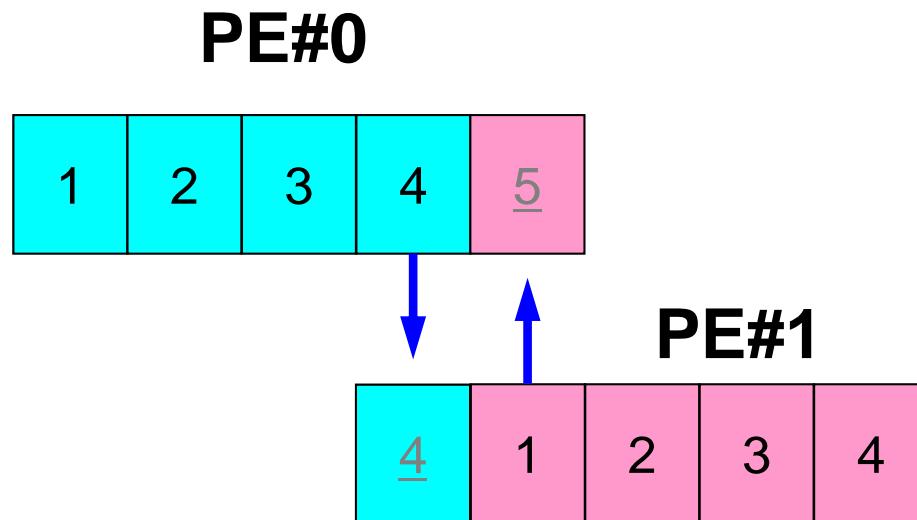

```
if (my_rank.eq.0) NEIB_ID=1  
if (my_rank.eq.1) NEIB_ID=0  
  
...  
if (my_rank.eq.0) then  
  call MPI_SEND (NEIB_ID, arg's)  
  call MPI_RECV (NEIB_ID, arg's)  
endif  
  
if (my_rank.eq.1) then  
  call MPI_RECV (NEIB_ID, arg's)  
  call MPI_SEND (NEIB_ID, arg's)  
endif  
  
...
```

- It works.
- It is OK for Structured Meshes for FDM (Finite Difference Method).

How to do PtoP Comm. ?

- Using “non-blocking” functions **MPI_Isend** & **MPI_Irecv** together with **MPI_Waitall** for synchronization
- **MPI_Sendrecv** is also available.

```
if (my_rank.eq.0) NEIB_ID=1  
if (my_rank.eq.1) NEIB_ID=0  
  
...  
call MPI_Isend (NEIB_ID, arg's)  
call MPI_Irecv (NEIB_ID, arg's)  
...  
call MPI_Waitall (for Irecv)  
...  
call MPI_Waitall (for Isend)
```

MPI_Waitall for both of
MPI_Isend/MPI_Irecv is possible

MPI_Irecv

- Begins a non-blocking send
 - Send the contents of sending buffer (starting from **sendbuf**, number of messages: **count**) to **dest** with **tag**.
 - Contents of sending buffer cannot be modified before calling corresponding **MPI_Waitall**.

- **MPI_Irecv**

(sendbuf, count, datatype, dest, tag, comm, request)

– sendbuf	choice	I	starting address of sending buffer
– count	int	I	number of elements in sending buffer
– datatype	MPI_Datatype	I	datatype of each sending buffer element
– dest	int	I	rank of destination
– tag	int	I	message tag This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI_Irecv and MPI_Irecv are matched. Usually tag is set to be "0" (in this class),
– comm	MPI_Comm	I	communicator
– request	MPI_Request	O	communication request array used in MPI_Waitall

Communication Request: request 通信識別子

- **MPI_Irecv**

(sendbuf, count, datatype, dest, tag, comm, request)

– <u>sendbuf</u>	choice	I	starting address of sending buffer
– <u>count</u>	int	I	number of elements in sending buffer
– <u>datatype</u>	MPI_Datatype	I	datatype of each sending buffer element
– <u>dest</u>	int	I	rank of destination
– <u>tag</u>	int	I	message tag

This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI_Irecv and MPI_Irecv are matched.

Usually tag is set to be "0" (in this class),
communicator

communication request used in MPI_Waitall

Size of the array is total number of neighboring processes

- Just define the array

MPI_Irecv

- Begins a non-blocking receive
 - Receiving the contents of receiving buffer (starting from **recvbuf**, number of messages: **count**) from **source** with **tag**.
 - Contents of receiving buffer cannot be used before calling corresponding **MPI_Waitall**.
- **MPI_Irecv**
(recvbuf, count, datatype, source, tag, comm, request)
 - **recvbuf** choice I starting address of receiving buffer
 - **count** int I number of elements in receiving buffer
 - **datatype** MPI_Datatype I datatype of each receiving buffer element
 - **source** int I rank of source
 - **tag** int I message tag
 - This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI_Isend and MPI_Irecv are matched.
Usually tag is set to be "0" (in this class),
communicator
 - **request** MPI_Request O communication request array used in MPI_Waitall

MPI_Waitall

C

- **MPI_Waitall** blocks until all comm's, associated with request in the array, complete. It is used for synchronizing **MPI_Isend** and **MPI_Irecv** in this class.
- At sending phase, contents of sending buffer cannot be modified before calling corresponding **MPI_Waitall**. At receiving phase, contents of receiving buffer cannot be used before calling corresponding **MPI_Waitall**.
- **MPI_Isend** and **MPI_Irecv** can be synchronized simultaneously with a single **MPI_Waitall** if it is consistent.
 - Same request should be used in **MPI_Isend** and **MPI_Irecv**.
- Its operation is similar to that of **MPI_Barrier** but, **MPI_Waitall** can not be replaced by **MPI_Barrier**.
 - Possible troubles using **MPI_Barrier** instead of **MPI_Waitall**: Contents of request and status are not updated properly, very slow operations etc.
- **MPI_Waitall (count, request, status)**
 - count int I number of processes to be synchronized
 - request MPI_Request I/O comm. request used in **MPI_Isend/Irecv** (array size: count)
 - status MPI_Status O array of status objects
MPI_STATUS_SIZE: defined in 'mpif.h', 'mpi.h'

Array of status object: **status**

状況オブジェクト配列

- **MPI_Waitall (count, request, status)**
 - count int I number of processes to be synchronized
 - request MPI_Request I/O comm. request used in MPI_Isend/Irecv (array size: count)
 - status MPI_Status O array of status objects
MPI_STATUS_SIZE: defined in 'mpif.h', 'mpi.h'
- Just define the array

RECV: receiving to external nodes

Recv. continuous data to recv. buffer from neighbors

- **`MPI_Irecv`**

(`recvbuf`, `count`, `datatype`, `source`, `tag`, `comm`, `request`)

<code>recvbuf</code>	choice	I	starting address of receiving buffer
<code>count</code>	int	I	number of elements in receiving buffer
<code>datatype</code>	MPI_Datatype	I	datatype of each receiving buffer element
<code>source</code>	int	I	rank of source

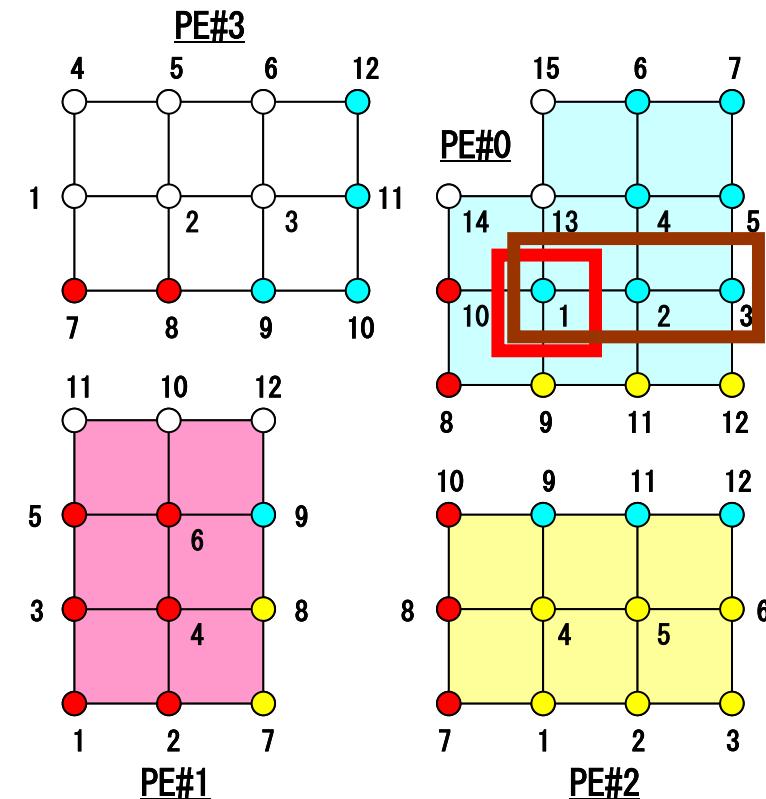

SEND: sending from boundary nodes

Send continuous data to send buffer of neighbors

- **`MPI_Isend`**

(`sendbuf`, `count`, `datatype`, `dest`, `tag`, `comm`, `request`)

<code>sendbuf</code>	choice	I	starting address of sending buffer
<code>count</code>	int	I	number of elements in sending buffer
<code>datatype</code>	MPI_Datatype	I	datatype of each sending buffer element
<code>dest</code>	int	I	rank of destination

An external point is only sent from its original domain.

A boundary point could be referred from more than one domain, and sent to multiple domains (e.g. 16th mesh).

Preparation of sending/receiving buffers

```
/*
!C
!C +-----+
!C | BUFFER |
!C +-----+
!C====*/
    SendBuf = calloc(ExportIndex[NeibPeTot], sizeof(*SendBuf));
    RecvBuf = calloc(ImportIndex[NeibPeTot], sizeof(*RecvBuf));

            SendBuf[i] = val[ExportItem[i]];
        }
    }
}
```

Info. of boundary points is written into sending buffer (**SendBuf**).

Info. sent to **NeibPe[neib]** is stored in **SendBuf[ExportIndex[neib]] : ExportIndex[neib+1]-1**

Sending Buffer is nice ...

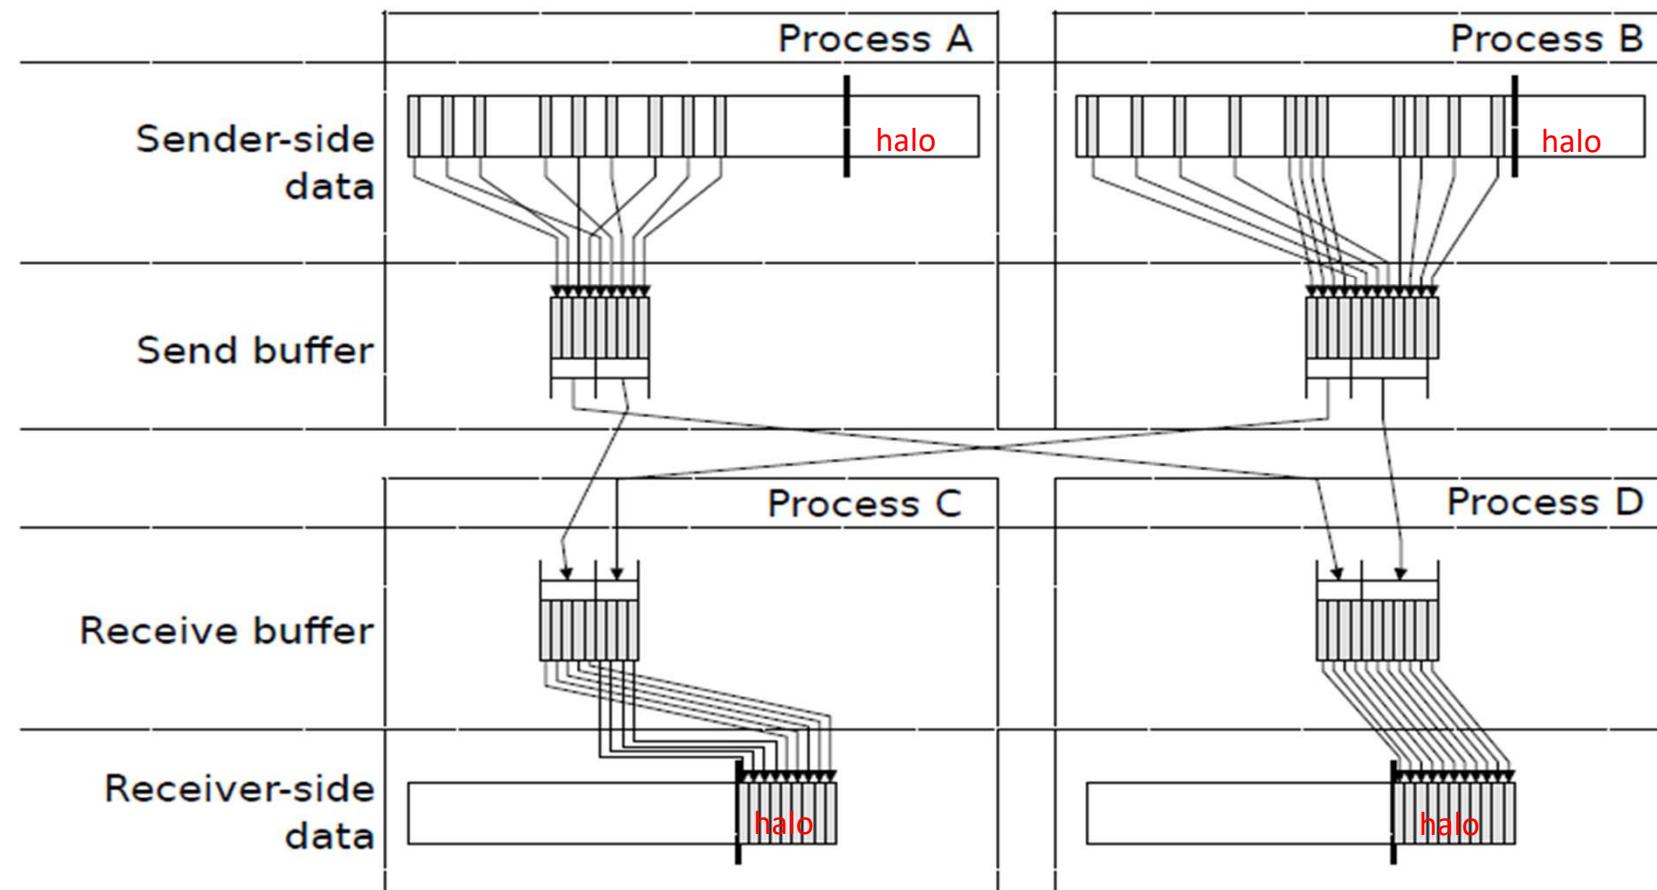

```
for (neib=0; neib<NeibPETot; neib++) {  
    tag= 0;  
    iS_e= export_index[neib];  
    iE_e= export_index[neib+1];  
    BUFlength_e= iE_e - iS_e  
  
    ierr= MPI_Isend  
        (&SendBuf[iS_e], BUFlength_e, MPI_DOUBLE, NeibPE[neib], 0,  
         MPI_COMM_WORLD, &ReqSend[neib])  
}
```

Numbering of these boundary nodes is not continuous, therefore the following procedure of MPI_Isend is not applied directly:

- Starting address of sending buffer
- XX-messages from that address

Distributed Local Data Structure for Parallel Computation

- Distributed local data structure for domain-to-domain communications has been introduced, which is appropriate for such applications with sparse coefficient matrices (e.g. FDM, FEM, FVM etc.).
 - SPMD
 - Local Numbering: Internal pts to External pts
 - Generalized communication table
- **Everything is easy, if proper data structure is defined:**
 - Values at boundary pts are copied into sending buffers
 - Send/Recv
 - Values at external pts are updated through receiving buffers

Report S2 (1/2)

- Parallelize 1D code (1d.c) using MPI
- Read entire element number, and decompose into sub-domains in your program
- Measure parallel performance

Report S2 (2/2)

- Deadline: January 30th (Tue), 2018, 17:00
 - Send files via e-mail at **nakajima (at) cc . u-tokyo . ac . jp**
- Problem
 - Apply “Generalized Communication Table”
 - Read entire elem. #, decompose into sub-domains in your program
 - Evaluate parallel performance
 - You need huge number of elements, to get excellent performance.
 - Fix number of iterations (e.g. 100), if computations cannot be completed.
- Report
 - Cover Page: Name, ID, and Problem ID (S2) must be written.
 - Less than eight pages including figures and tables (A4).
 - Strategy, Structure of the Program, Remarks
 - Source list of the program (if you have bugs)
 - Output list (as small as possible)
