Introduction to Parallel Programming for Multicore/Manycore Clusters

Introduction

Kengo Nakajima
Information Technology Center
The University of Tokyo

http://nkl.cc.u-tokyo.ac.jp/20s/

Descriptions of the Class

- Technical & Scientific Computing I (4820-1027)
  - 科学技術計算Ⅰ
  - Department of Mathematical Informatics
- Special Lecture on Computational Alliance I(4810-1215)
  - 計算科学アライアンス特別講義Ⅰ
  - Department of Computer Science
- Multithreaded Parallel Computing (3747-110)
  - スレッド並列コンピューティング
  - Department of Electrical Engineering & Information Systems
- This class is certificated as the category “D” lecture of "the Computational Alliance, the University of Tokyo"

- 2009-2014
  - Introduction to FEM Programming
    - FEM: Finite-Element Method：有限要素法
  - Summer (I) : FEM Programming for Solid Mechanics
  - Winter (II): Parallel FEM using MPI
    - The 1st part (summer) is essential for the 2nd part (winter)
- Problems
  - Many new (international) students in Winter, who did not take the 1st part in Summer
  - **They are generally more diligent than Japanese students**
- 2015
  - Summer (I) : Multicore programming by OpenMP
  - Winter (II): FEM + Parallel FEM by MPI/OpenMP for Heat Transfer
    - Part I & II are independent (maybe...)
- **2017**
  - **Lectures are given in English**
  - **Reedbush-U Supercomputer System**
- **2020**
  - **Oakbridge-CX Supercomputer System**

Motivation for Parallel Computing (and this class)

- Large-scale parallel computer enables fast computing in large-scale scientific simulations with detailed models. Computational science develops new frontiers of science and engineering.
- Why parallel computing ?
  - faster & larger
  - “larger” is more important from the view point of “new frontiers of science & engineering”, but “faster” is also important.
  - + more complicated
  - Ideal: Scalable
    - Solving N^x scale problem using N^x computational resources during same computation time (weak scaling)
    - Solving a fix-sized problem using N^x computational resources in 1/N computation time (strong scaling)

Scientific Computing = SMASH

Science

Modeling

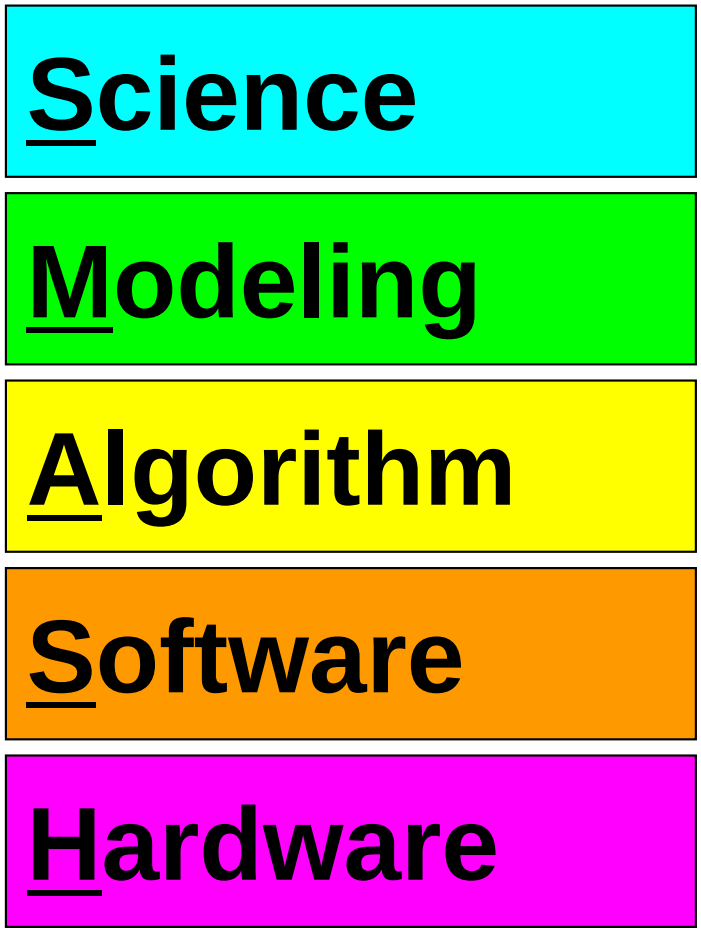
Algorithm

Software

Hardware

- You have to learn many things
- Collaboration/Co-Design needed
  - They will be important for future career of each of you, as a scientist and/or an engineer.
  - You have to communicate with people with different backgrounds
    - **I hope you can extend your knowledge/experiences a little bit from your original area through this class for your future career**
  - It is more difficult than communicating with foreign scientists from same area.
- (Q): Computer Science, Computational Science, or Numerical Algorithms ?

This Class ...



- **Target: Parallel FVM (Finite-Volume Method) using OpenMP**
- Science: 3D Poisson Equations
- Modeling: FVM
- Algorithm: Iterative Solvers etc.

- You have to know many components to learn FVM, although you have already learned each of these in undergraduate and high-school classes.

Road to Programming for “Parallel” Scientific Computing

Programming for Parallel Scientific Computing (e.g. Parallel FEM/FDM)

Programming for Real World Scientific Computing (e.g. FEM, FDM)

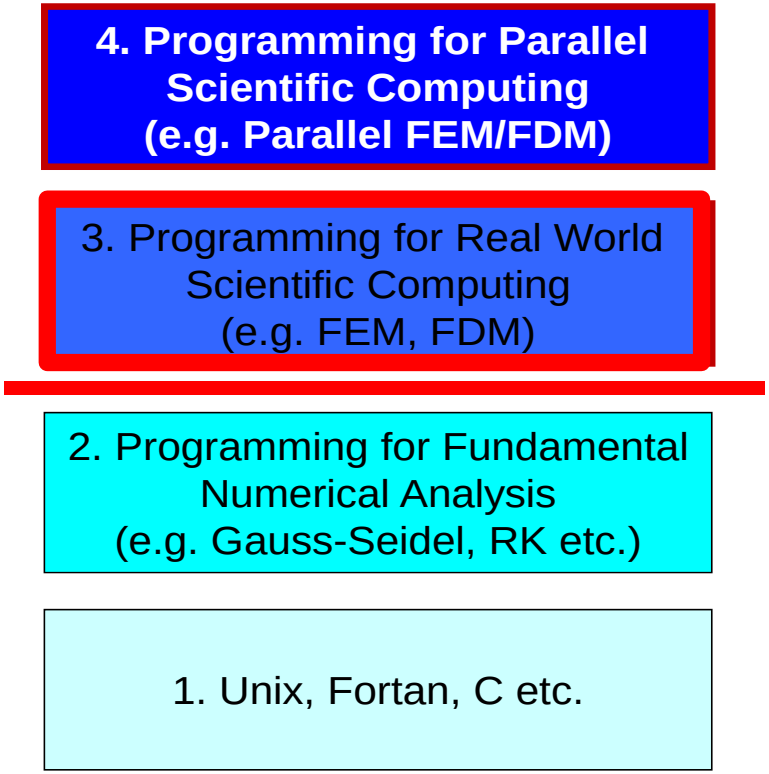
Big gap here !!

Programming for Fundamental Numerical Analysis (e.g. Gauss-Seidel, RK etc.)

Unix, Fortan, C etc.

The third step is important !

- How to parallelize applications ?
  - How to extract parallelism ?
  - If you understand methods, algorithms, and implementations of the original code, it's easy.
  - "Data-structure" is important



- How to understand the code ?
  - Reading the application code !!
  - It seems primitive, but very effective.
  - In this class, "reading the source code" is encouraged.
  - 3: FVM, 4: Parallel FVM

Kengo Nakajima 中島研吾 (1/2)

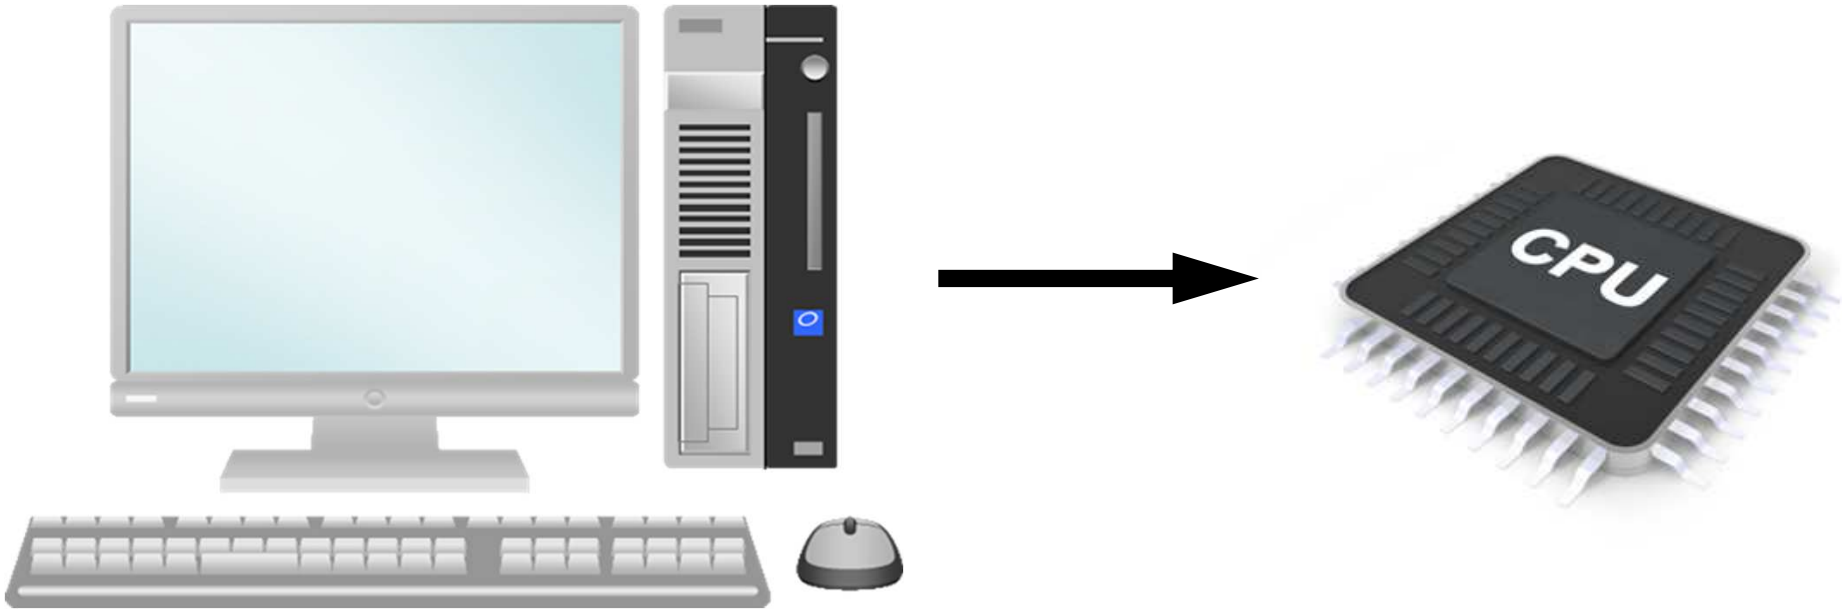
- Current Position
  - Professor, Supercomputing Research Division, Information Technology Center, The University of Tokyo（情報基盤センター）
    - Department of Mathematical Informatics, Graduate School of Information Science & Engineering, The University of Tokyo（情報理工・数理情報学）
    - Department of Electrical Engineering and Information Systems, Graduate School of Engineering, The University of Tokyo（工・電気系工学）
  - Deputy Director, RIKEN R-CCS (Center for Computational Science) (Kobe) (20%) (2018.Apr.-)
- Research Interest
  - High-Performance Computing
  - Parallel Numerical Linear Algebra (Preconditioning)
  - Parallel Programming Model
  - Computational Mechanics, Computational Fluid Dynamics
  - Adaptive Mesh Refinement, Parallel Visualization

Kengo Nakajima (2/2)

- Education
  - B.Eng (Aeronautics, The University of Tokyo, 1985)
  - M.S. (Aerospace Engineering, University of Texas, 1993)
  - Ph.D. (Quantum Engineering & System Sciences, The University of Tokyo, 2003)
- Professional
  - Mitsubishi Research Institute, Inc. (1985-1999)
  - Research Organization for Information Science & Technology (1999-2004)
  - The University of Tokyo
    - Department Earth & Planetary Science (2004-2008)
    - Information Technology Center (2008-)
  - JAMSTEC (2008-2011), part-time
  - RIKEN (2009-2018), part-time

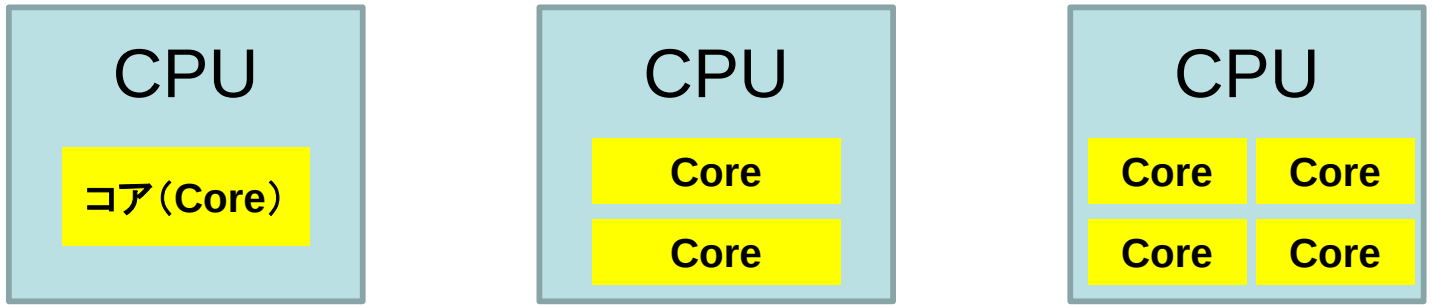
- **Supercomputers and Computational Science**
- Overview of the Class
- Future Issues

Computer & CPU



- Central Processing Unit（中央処理装置）:CPU
- CPU’s used in PC and Supercomputers are based on same architecture
- GHz: Clock Rate
  - Frequency: Number of operations by CPU per second
    - GHz -> 10^9 operations/sec
  - Simultaneous 4-8 (or more) instructions per clock

Multicore CPU

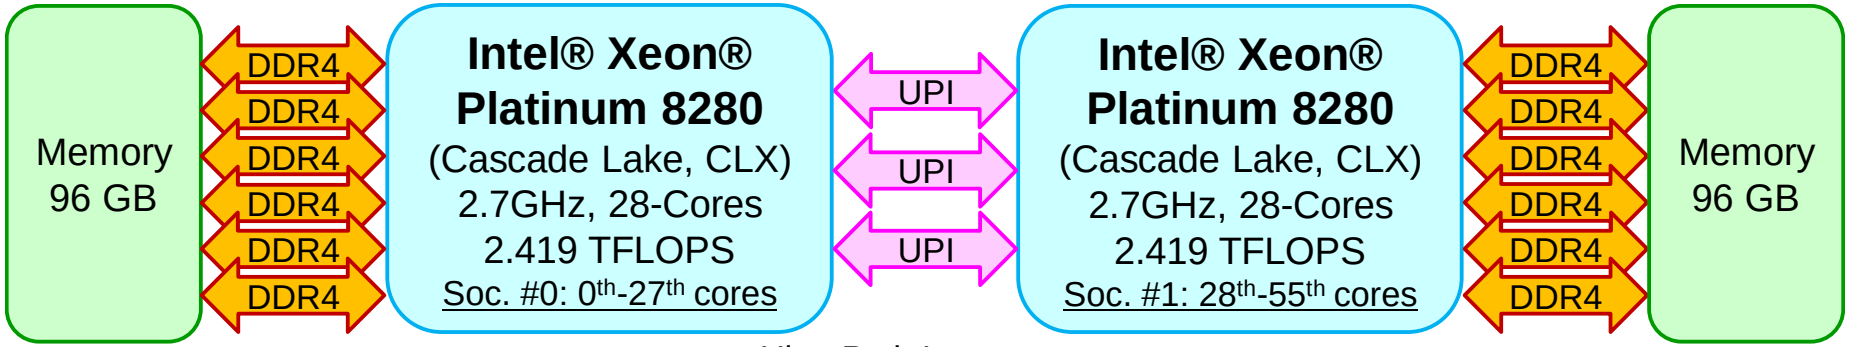


Single Core
1 cores/CPU

Dual Core
2 cores/CPU

Quad Core
4 cores/CPU

- Core= Central part of CPU
- Multicore CPU's with 4-8 cores are popular
  - Low Power



2933 MHz × 6ch
140.8 GB/sec

Ultra Path Interconnect
10.4 GT/sec × 3
= 124.8 GB/sec

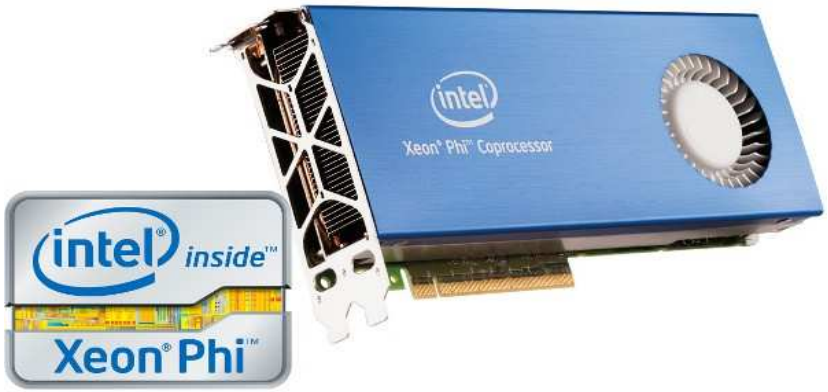
2933 MHz × 6ch
140.8 GB/sec

- GPU: Manycore
  - $O(10^1)$-$O(10^2)$ cores
- More and more cores
  - Parallel computing

- Oakbridge-CX: 28 cores x 2
  - Intel Xeon Platinum 8280
  - Cascade Lake, CLX
  - Intel Xeon SP
    - Scalable Processor

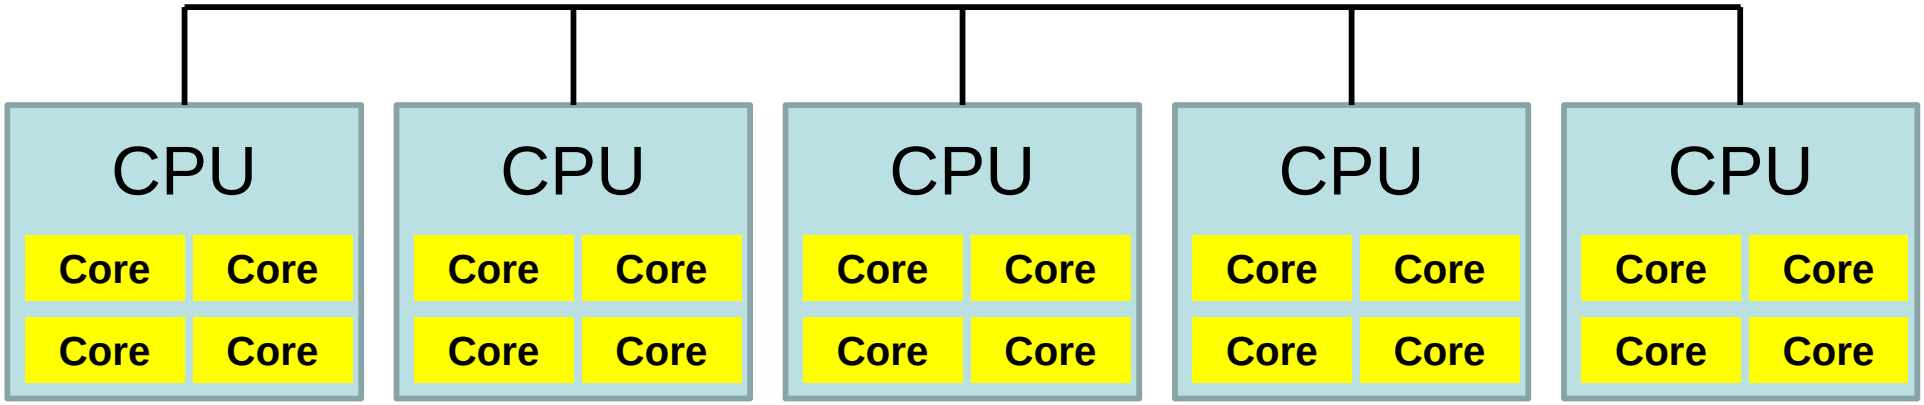
GPU/Manycores

- GPU : Graphic Processing Unit
  - GPGPU: General Purpose GPU
  - $O(10^2)$ cores
  - High Memory Bandwidth
  - (was) cheap
  - NO stand-alone operations
    - Host CPU needed
  - Programming: CUDA, OpenACC
- Intel Xeon/Phi: Manycore CPU
  - 60+ cores
  - High Memory Bandwidth
  - Unix, Fortran, C compiler
  - Host CPU NOT needed
    - Needed in the 1st generation

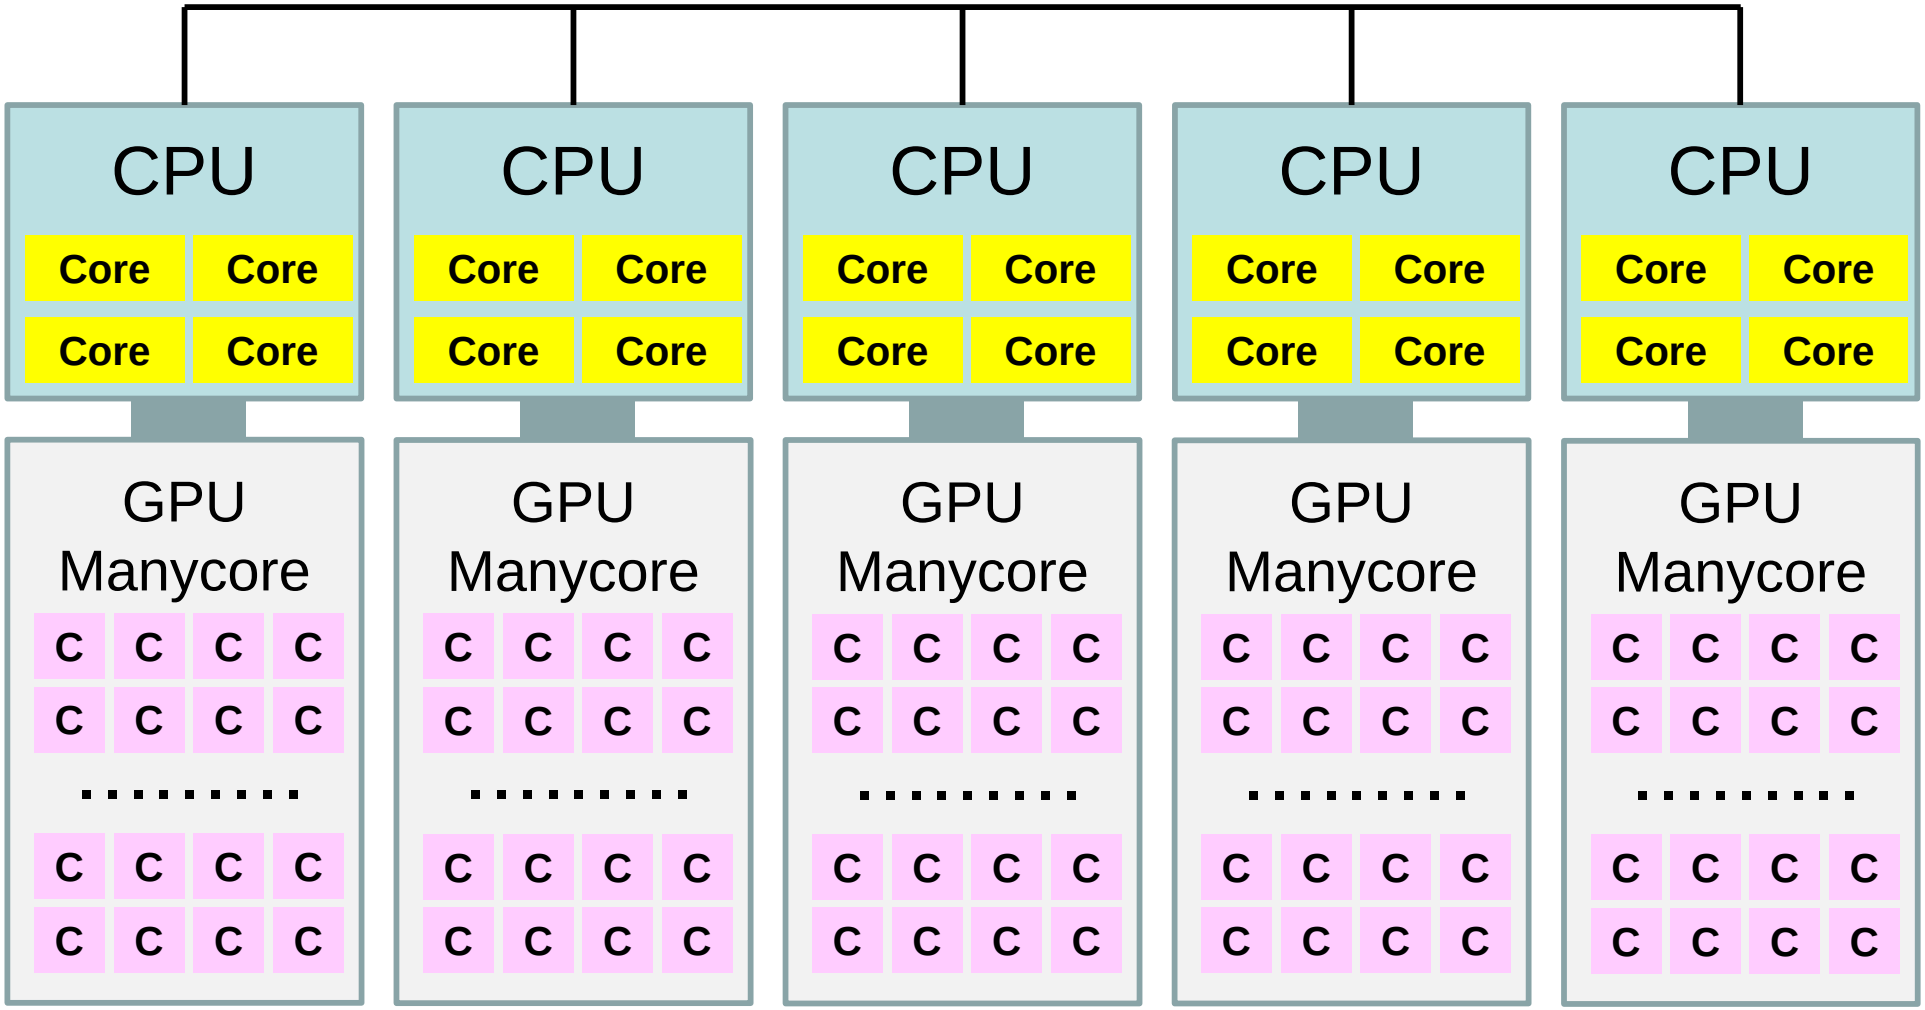


Parallel Supercomputers

Multicore CPU’s are connected through network



Supercomputers with Heterogeneous/Hybrid Nodes



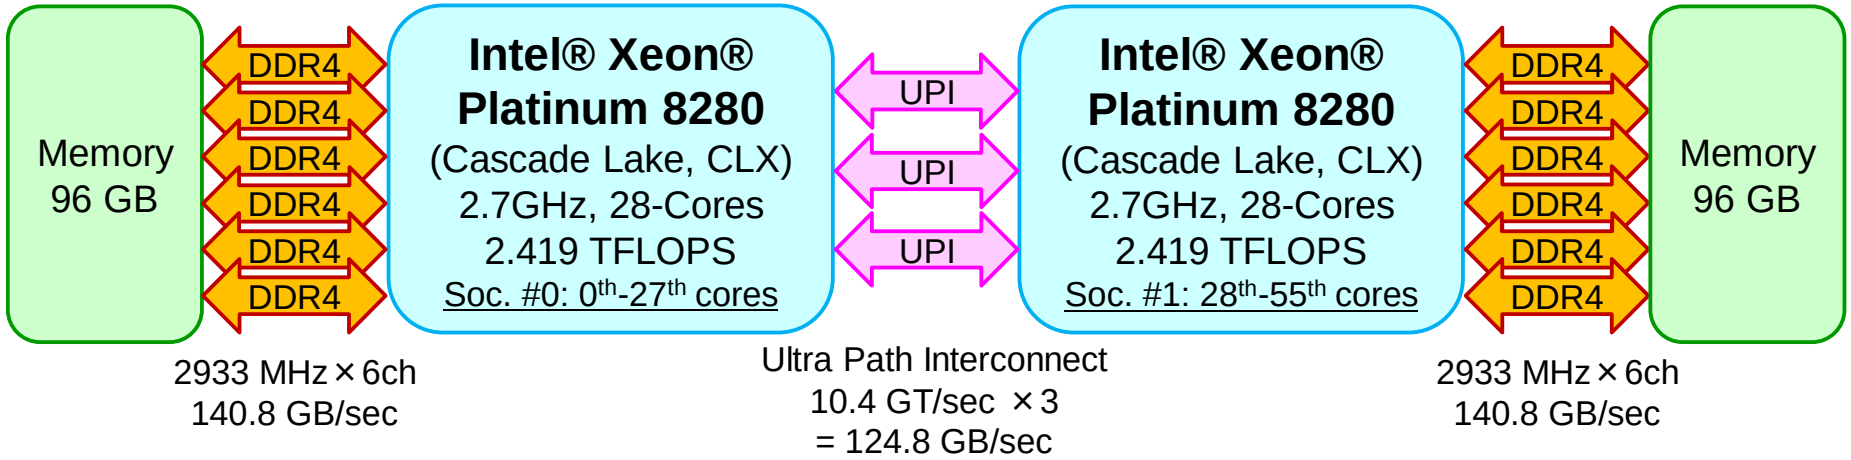
Performance of Supercomputers

- Performance of CPU: Clock Rate
- FLOPS (Floating Point Operations per Second)
  - Real Number
- Recent Multicore CPU
  - 4-8 (or more) FLOPS per Clock
  - (e.g.) Peak performance of a core with 3GHz
    - $3 \times 10^9 \times 4(\text{or } 8) = 12(\text{or } 24) \times 10^9$ FLOPS=12(or 24)GFLOPS

    - 10^6 FLOPS= 1 Mega FLOPS = 1 MFLOPS
    - 10^9 FLOPS= 1 Giga FLOPS = 1 GFLOPS
    - 10^{12} FLOPS= 1 Tera FLOPS = 1 TFLOPS
    - 10^{15} FLOPS= 1 Peta FLOPS = 1 PFLOPS
    - 10^{18} FLOPS= 1 Exa FLOPS = 1 EFLOPS

Peak Performance of Oakbridge-CX

Intel Xeon Plarinum 8280 (Cascade Lake, Intel Xeon SP)



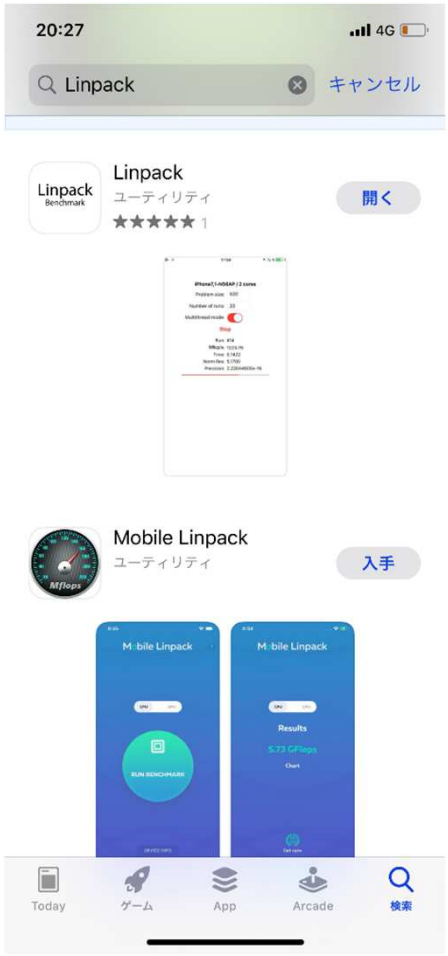
- 2.7 GHz
  - 32 DP (Double Precision) FLOP operations per Clock
- Peak Performance (1 core)
  - 2.7 × 32= 86.4 GFLOPS
- Peak Performance
  - 1-Socket, 28 cores: 2,419.2 GFLOPS= 2.419 TFLOPS
  - 2-Sockets, 56 cores: 4,838.4 GFLOPS= 4.838 TFLOPS 1-Node

TOP 500 List

http://www.top500.org/

- Ranking list of supercomputers in the world
- Performance (FLOPS rate) is measured by “Linpack” which solves large-scale linear equations.
  - Since 1993
  - Updated twice a year (International Conferences in June and November)
- Linpack
  - Available in iPhone and Android
- Oakbridge-CX (OBCX) is 50th in the TOP 500 (November 2019)

Linpack on My iPhone XS



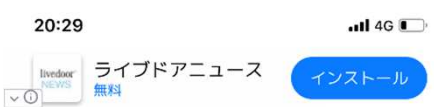
Normal Mode

iPhone11,2-D321AP / 6 cores
Problem size: 500
Number of runs: 10
Multithread mode:
Run benchmark
Run: #10
Mflop/s: 18800.05
Time: 0.0364
Norm Res: 5.1700
Precision: 2.22044605e
Max Mflop/s: 20627.07
Avg Mflop/s: 17294.78

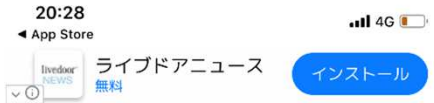
Low-Power Mode

iPhone11,2-D321AP / 6 cores
Problem size: 500
Number of runs: 10
Multithread mode:
Run benchmark
Run: #10
Mflop/s: 8359.34
Time: 0.0726
Norm Res: 5.1700
Precision: 2.22044605e-16
Max Mflop/s: 11868.06
Avg Mflop/s: 9329.87

Multithread (parallel)



iPhone11,2-D321AP / 6 cores
Problem size: 500
Number of runs: 10
Multithread mode:
Run benchmark
Run: #10
Mflop/s: 5511.57
Time: 0.0152
Norm Res: 5.1700
Precision: 2.22044605e-16
Max Mflop/s: 5521.89
Avg Mflop/s: 4921.39

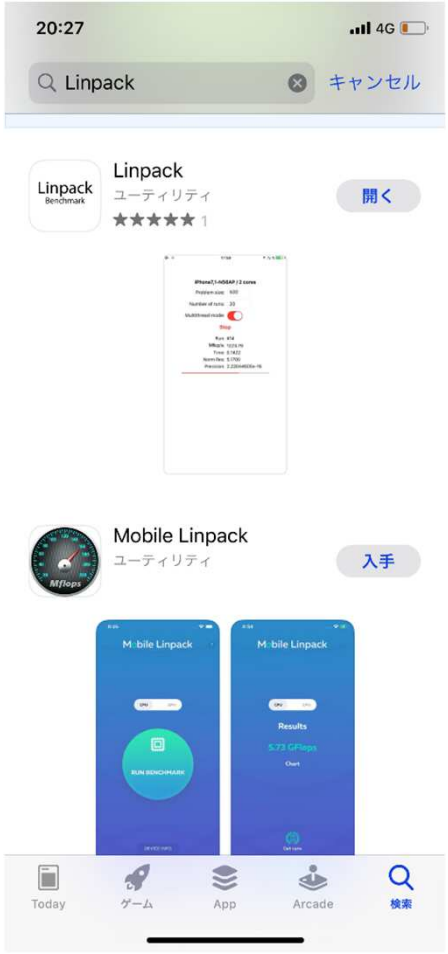


iPhone11,2-D321AP / 6 cores
Problem size: 500
Number of runs: 10
Multithread mode:
Run benchmark
Run: #10
Mflop/s: 3737.27
Time: 0.0224
rm Res: 5.1700
Precision: 2.22044605e-16
Max Mflop/s: 3769.22
Avg Mflop/s: 3586.08

Single-thread (serial)

- Performance of my iPhone XS is about 20,000 Mflops
- Cray-1S
  - Supercomputer of my company in 1985 with 80 Mflops
  - I do not know the price, but we had to pay 10 USD for 1 sec. computing !

Linpack on My iPhone XS



Normal Mode

Low-Power Mode

- You can change Problem size, and # of runs.
  - "Size=500" means linear equations Ax=b with 500 unknowns are solved
- Actually, problem size affects performance of computing so much !!

- PFLOPS: Peta (=10^{15}) Floating OPerations per Sec.
- Exa-FLOPS (=10^{18}) will be attained in 2021 …

http://www.top500.org/

Benchmarks

- TOP 500 (Linpack, HPL(High Performance Linpack))
  - Direct Linear Solvers, FLOPS rate
  - Regular Dense Matrices, Continuous Memory Access
  - Computing Performance
- HPCG
  - Preconditioned Iterative Solvers, FLOPS rate
  - Irregular Sparse Matrices derived from FEM Applications with Many “0” Components
    - Irregular/Random Memory Access,
    - Closer to “Real” Applications than HPL
  - Performance of Memory, Communications
- Green 500
  - FLOPS/W rate for HPL (TOP500)

54th TOP500 List (Nov., 2019) Oakbridge-CX (OBCX) is 50th

R_{max}: Performance of Linpack (TFLOPS)
R_{peak}: Peak Performance (TFLOPS),
Power: kW

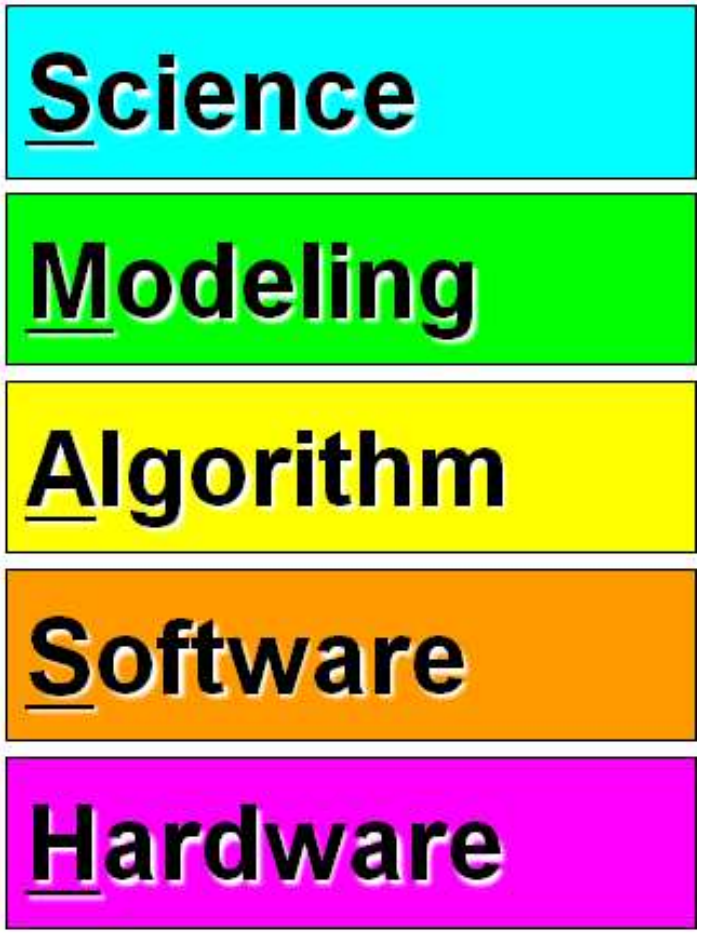
図 -5　圧力上昇量の平面分布（初期状態からの増分、圧入開始から 100 年後）

[Dr. Hajime Yamamoto, Taisei]

Simulation of Geologic CO_2 Storage

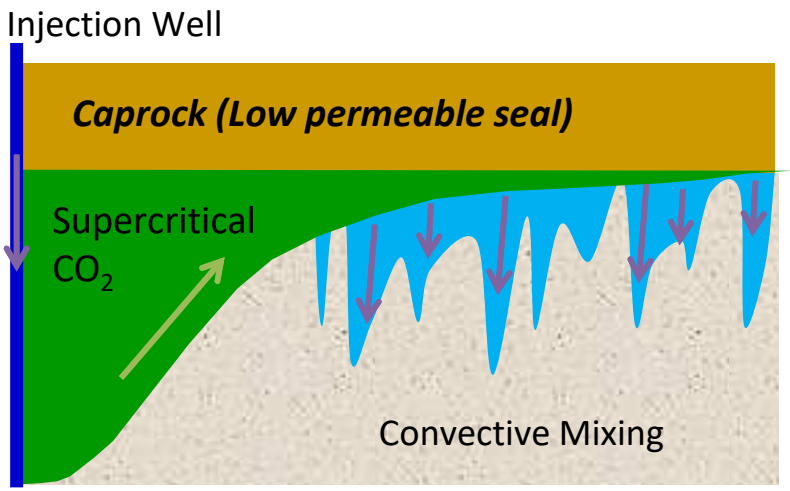
- International/Interdisciplinary Collaborations
  - Taisei (Science, Modeling)
  - Lawrence Berkeley National Laboratory, USA (Modeling)
  - Information Technology Center, the University of Tokyo (Algorithm, Software)
  - JAMSTEC (Earth Simulator Center) (Software, Hardware)
  - NEC (Software, Hardware)
- 2010 Japan Geotechnical Society (JGS) Award



Simulation of Geologic CO_2 Storage

- Science
  - Behavior of CO_2 in supercritical state at deep reservoir
- PDE's
  - 3D Multiphase Flow (Liquid/Gas) + 3D Mass Transfer
- Method for Computation
  - TOUGH2 code based on FVM, developed by Lawrence Berkeley National Laboratory, USA
    - More than 90% of computation time is spent for solving large-scale linear equations with more than 10^7 unknowns
- Numerical Algorithm
  - Fast algorithm for large-scale linear equations developed by Information Technology Center, the University of Tokyo
- Supercomputer
  - Earth Simulator II (NEX SX9, JAMSTEC, 130 TFLOPS)
  - Oakleaf-FX (Fujitsu PRIMEHP FX10, U.Tokyo, 1.13 PFLOPS

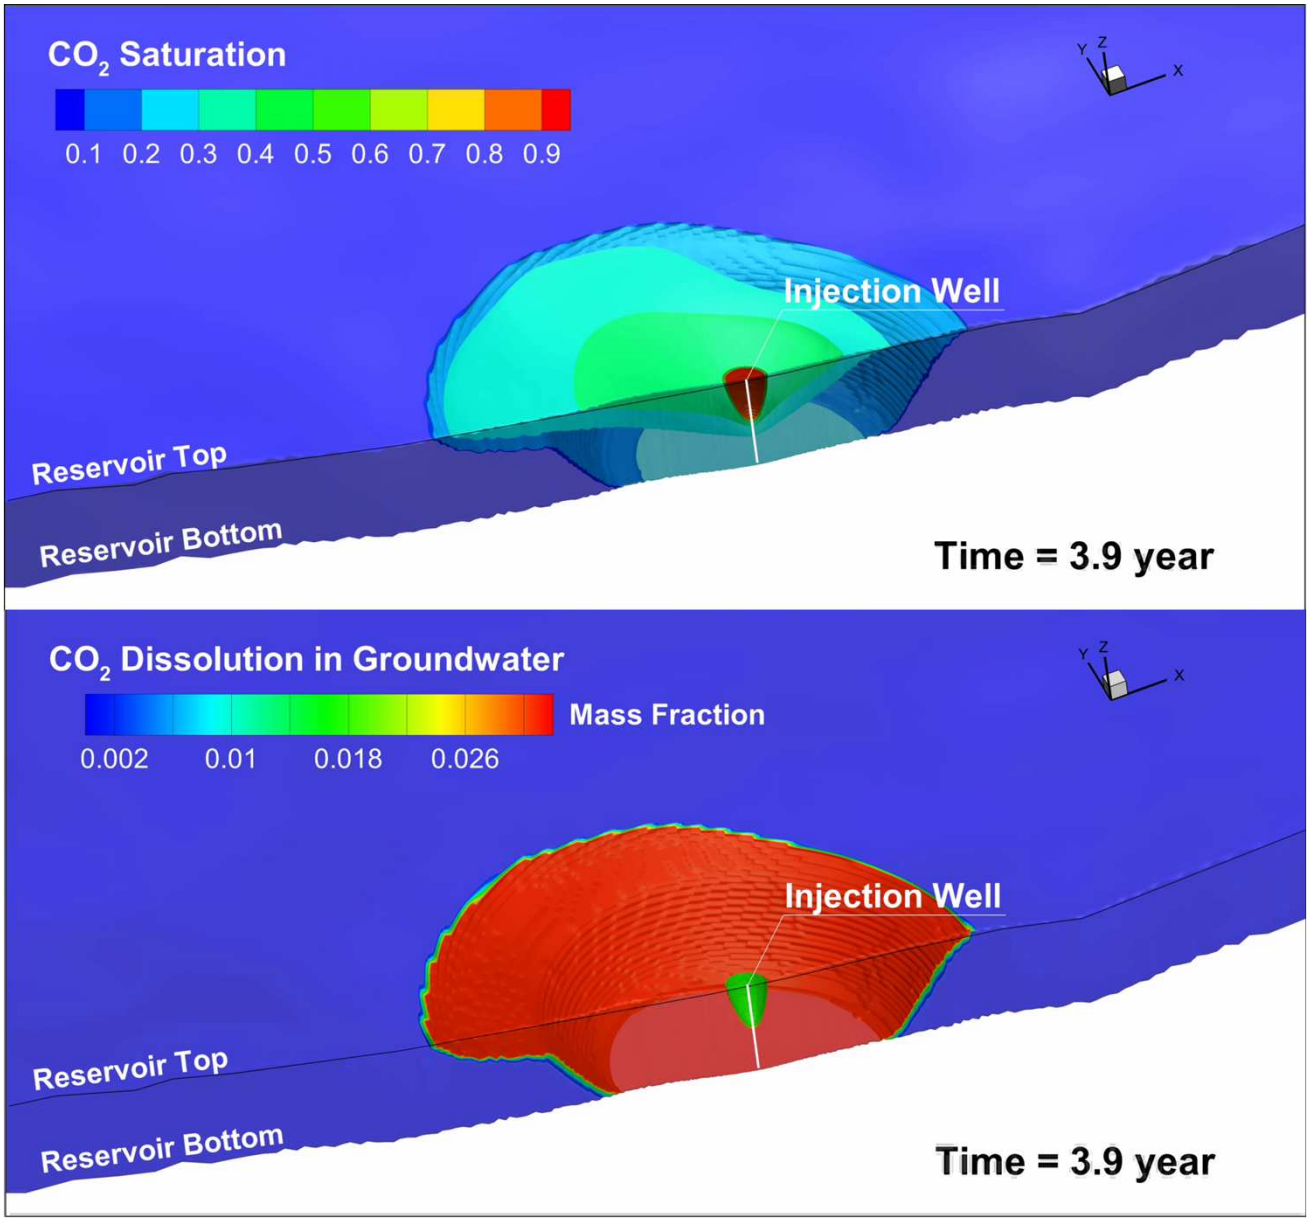
Diffusion-Dissolution-Convection Process



- **Buoyant scCO_2 overrides onto groundwater**
- **Dissolution of CO_2 increases water density**
- **Denser fluid laid on lighter fluid**
- **Rayleigh-Taylor instability invokes convective mixing of groundwater**

The mixing significantly enhances the CO_2 dissolution into groundwater, resulting in more stable storage

Preliminary 2D simulation (Yamamoto et al., GHGT11) [Dr. Hajime Yamamoto, Taisei]



Density convections for 1,000 years: Flow Model

Only the far side of the vertical cross section passing through the injection well is depicted.

Reservoir Condition

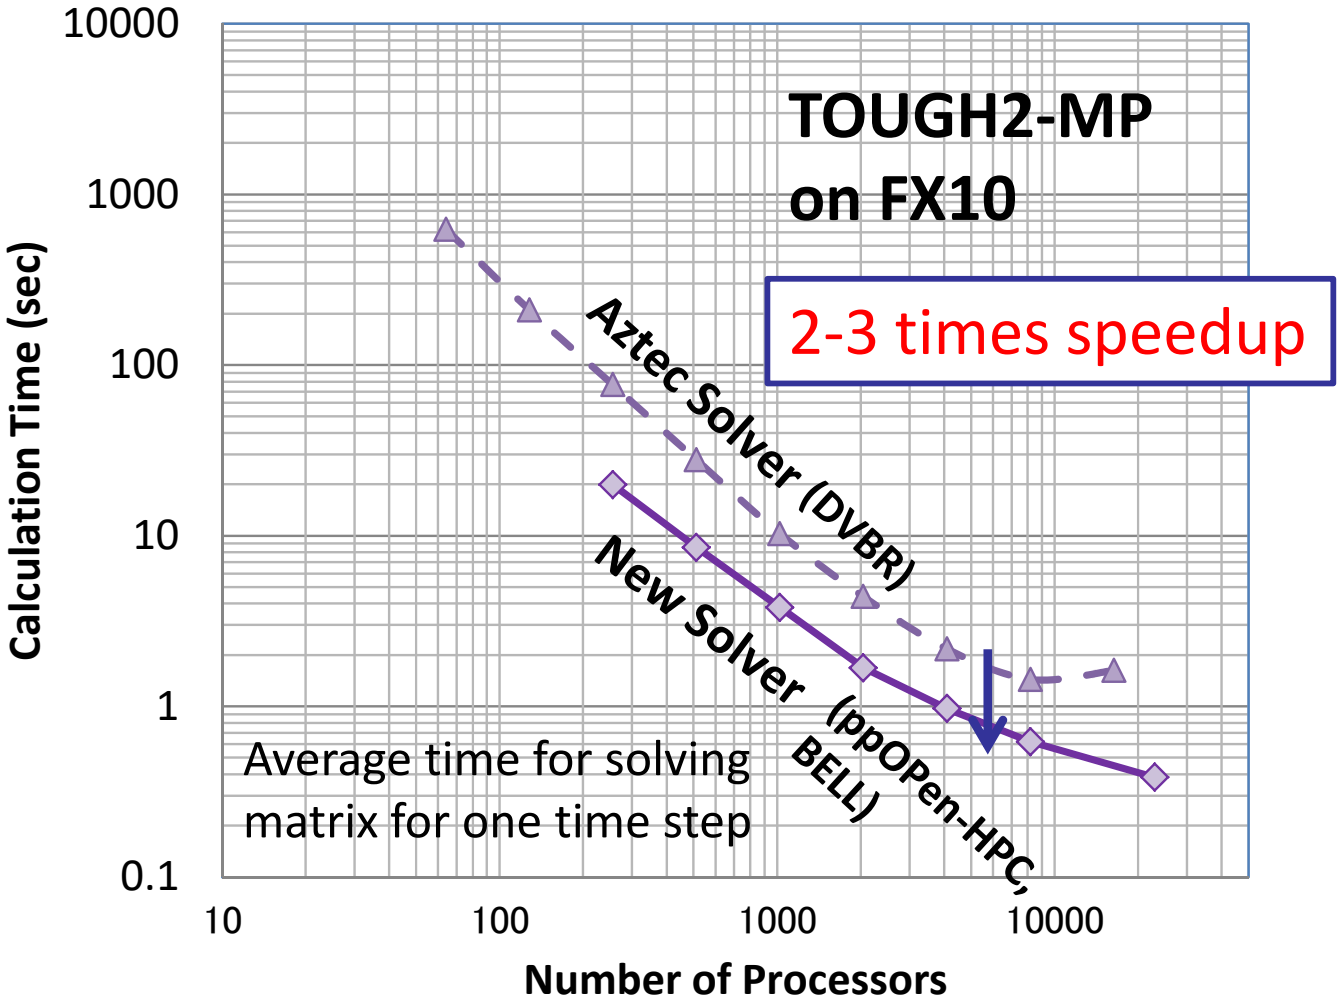
- Permeability: 100 md
- Porosity: 20%
- Pressure: 3MPa
- Temperature: 100°C
- Salinity: 15wt%

[Dr. Hajime Yamamoto, Taisei]

- The meter-scale fingers gradually developed to larger ones in the field-scale model
- Huge number of time steps (> 10^5) were required to complete the 1,000-yrs simulation
- Onset time (10-20 yrs) is comparable to theoretical (linear stability analysis, 15.5yrs)

Simulation of Geologic CO_2 Storage

30 million DoF (10 million grids × 3 DoF/grid node)



[Dr. Hajime Yamamoto, Taisei]

!C- SEND

      do neib= 1, NEIBPETOT
        II= (LEVEL-1)*NEIBPETOT
        istart= STACK_EXPORT(II+neib-1)
        inum  = STACK_EXPORT(II+neib  ) - istart
!$omp parallel do
        do k= istart+1, istart+inum
          WS(k-NE0)= X(NOD_EXPORT(k))
        enddo

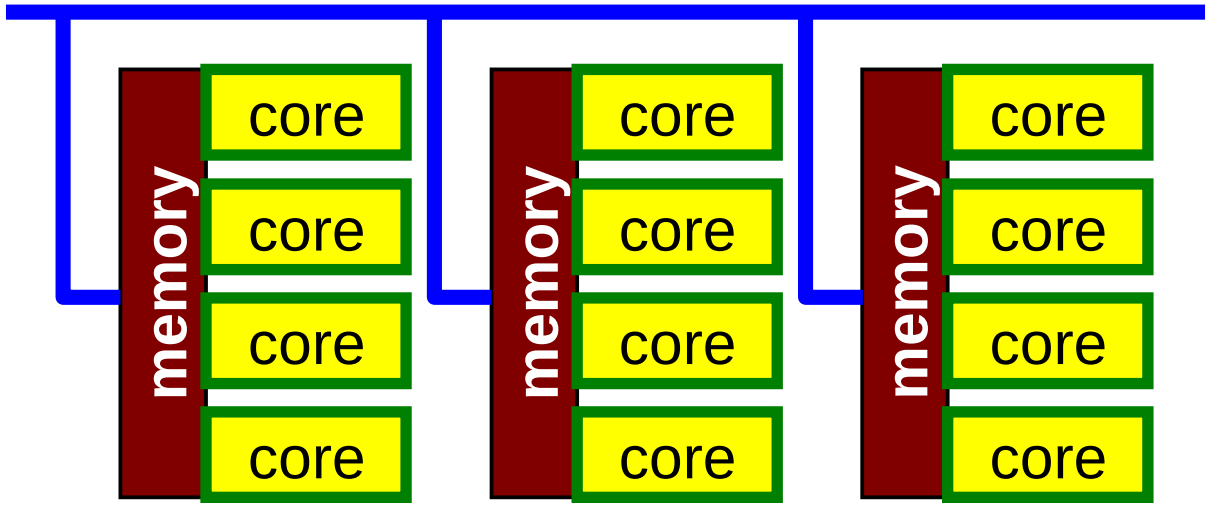
        call MPI_Isend (WS(istart+1-NE0), inum, MPI_DOUBLE_PRECISION,   &
     &                  NEIBPE(neib), 0, MPI_COMM_WORLD,                &
     &                  req1(neib), ierr)
      enddo
```

Overview of This Class (1/3)

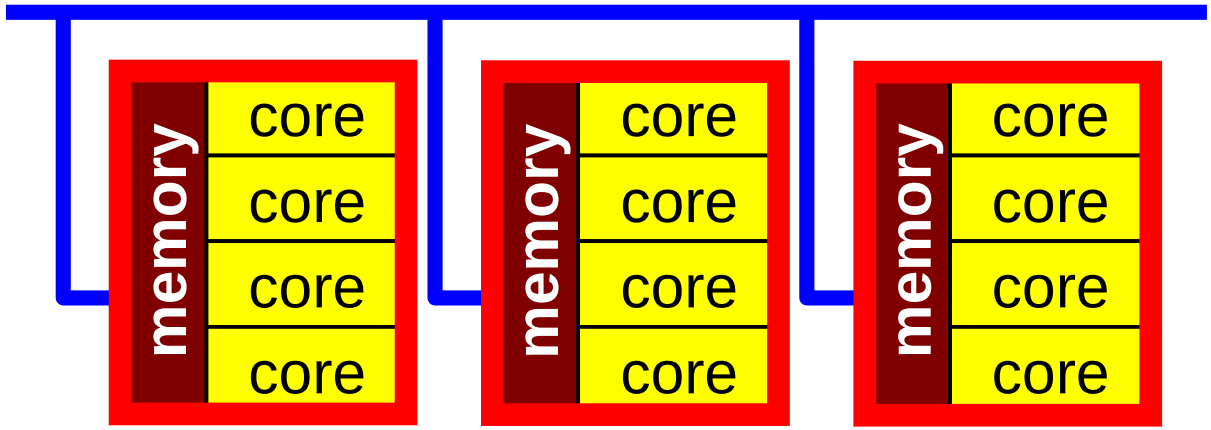
- https://nkl.cc.u-tokyo.ac.jp/20s/
- In order to make full use of modern supercomputer systems with multicore/manycore architectures, hybrid parallel programming with message-passing and multithreading is essential.
- While MPI is widely used for message-passing, OpenMP for CPU and OpenACC for GPU are the most popular ways for multithreading on multicore/manycore clusters.
- **In this class, we "parallelize" a finite-volume method code with Krylov iterative solvers for Poisson's equation on Oakbridge-CX (OBCX) Supercomputer with Intel Cascade Lake (CLX) at the University of Tokyo.**
  - **Because of limitation of time, we are (mainly) focusing on multithreading by OpenMP.**

Flat MPI vs. Hybrid

Flat-MPI：Each PE -> Independent



Hybrid：Hierarchal Structure



Overview of This Class (2/3)

- We “parallelize” a finite-volume method (FVM) code with Krylov iterative solvers for Poisson’s equation.
- Derived linear equations are solved by ICCG (Conjugate Gradient iterative solvers with Incomplete Cholesky preconditioning), which is a widely-used method for solving linear equations.
- Because ICCG includes “data dependency”, where writing/reading data to/from memory could occur simultaneously, parallelization using OpenMP is not straight forward.
- We need certain kind of reordering in order to extract parallelism.

Overview of This Class (3/3)

- Lectures and exercise on the following issues **related to OpenMP** will be conducted:
  - Overview of Finite-Volume Method (FVM)
  - Kyrilov Iterative Method, Preconditioning
  - Implementation of the Program
  - Introduction to OpenMP
  - **Reordering/Coloring Method**
  - Parallel FVM by OpenMP

Jul-22 (W)	CS-12	Advanced Topics, Q/A

“Prerequisites”

- Fundamental physics and mathematics
  - Linear algebra, analytics
- Experiences in fundamental numerical algorithms
  - Gaussian Elimination, LU Factorization
  - Jacobi/Gauss-Seidel/SOR Iterative Solvers
  - Conjugate Gradient Method (CG)
- Experiences in programming by C or Fortran
- **Experiences in Unix/Linux (vi or emacs)**
  - **If you are not familiar with Unix/Linux (vi or emacs), please try “Introduction Unix”, “Introduction emacs” in google.**
- Experiences in Programming by C/C++/Fortran
- User account of ECCS2016 must be obtained (later)
  - https://www.ecc.u-tokyo.ac.jp/en/newaccount.html

Strategy

- If you can develop programs by yourself, it is ideal... but difficult.
  - You can focuse on “reading”, not developing by yourself
  - Programs are in C and Fortran
    - Lectures are done by ...
- Lecture Materials
  - available at **NOON Moday** through WEB.
    - http://nkl.cc.u-tokyo.ac.jp/20s/
  - NO hardcopy is provided
- Starting at 08:30
  - You can enter the building/ZOOM classroom after 08:00
- In the Classroom …
  - Taking seats from the front row
  - Terminals must be shut-down after class

Grades

- 1 Report on programming

If you have any questions, please feel free to contact me !

- Office: 3F Annex/Information Technology Center #36
  - 情報基盤センター別館3F 36号室
- ext.: 22719
- e-mail: nakajima(at)cc.u-tokyo.ac.jp

- **NO specific office hours, appointment by e-mail**

- http://nkl.cc.u-tokyo.ac.jp/20s/
- http://nkl.cc.u-tokyo.ac.jp/seminars/multicore/　日本語資料（一部）

Keywords for OpenMP

- OpenMP
  - Directive based, (seems to be) easy
  - Many books

- Data Dependency
  - Conflict of reading from/writing to memory
  - Appropriate reordering of data is needed for “consistent” parallel computing
  - NO detailed information in OpenMP books: very complicated

Some Technical Terms

- Processor, Core
  - Processing Unit (H/W), Processor=Core for single-core proc's
- Process
  - Unit for MPI computation, nearly equal to "core"
  - Each core (or processor) can host multiple processes (but not efficient)
- PE (Processing Element)
  - PE originally mean "processor", but it is sometimes used as "process" in this class. Moreover it means "domain" (next)
    - In multicore proc's: PE generally means "core"
- Domain
  - domain=process (=PE), each of "MD" in "SPMD", each data set
  - Domain Decomposition

Preparation

- Windows
  - Cygwin with gcc/gfortran and OpenSSH
    - Please make sure to install gcc (C) or gfortran (Fortran) in “Devel”, and OpenSSH in “Net”
  - ParaView

- MacOS, UNIX/Linux
  - ParaView
- Cygwin: https://www.cygwin.com/
- ParaView: http://www.paraview.org

- Supercomputers and Computational Science
- Overview of the Class
- **Future Issues**

Technical Issues: Future of Supercomputers

- Power Consumption
- Reliability, Fault Tolerance, Fault Resilience
- Scalability (Parallel Performance)

Key-Issues towards Appl./Algorithms on Exa-Scale Systems

Jack Dongarra (ORNL/U. Tennessee) at ISC 2013

- Hybrid/Heterogeneous Architecture
  - Multicore + GPU/Manycores (Intel MIC/Xeon Phi)
    - Data Movement, Hierarchy of Memory
- Communication/Synchronization Reducing Algorithms
- Mixed Precision Computation
- Auto-Tuning/Self-Adapting
- Fault Resilient Algorithms
- Reproducibility of Results

Supercomputers with Heterogeneous/Hybrid Nodes
