- **MPI\_Send, MPI\_Recv**
- These are “blocking” functions.
  - “Dead lock” occurs for these “blocking” functions.
- A “blocking” MPI call means that the program execution will be suspended until the message buffer is safe to use.
- The MPI standards specify that a blocking SEND or RECV does not return until the send buffer is safe to reuse (for MPI\_Send), or the receive buffer is ready to use (for MPI\_Recv).
  - Blocking comm. confirms “secure” communication, but it is very inconvenient and impractical.
- Please just remember that “there are such functions”.

# MPI\_Send/MPI\_Recv

```
if (my_rank.eq.0) NEIB_ID=1  
if (my_rank.eq.1) NEIB_ID=0  
  
...  
call MPI_SEND (NEIB_ID, arg's)  
call MPI_RECV (NEIB_ID, arg's)  
...
```

- This seems reasonable, but it stops at MPI\_Send/MPI\_Recv.
  - Sometimes it works (according to implementation).
- “Sending 0-to-1” does not terminate, until “Receiving@1-from-0 is done.
  - But, “Sending 1-to-0” does not terminate, if “Receiving@0-from-1” is not done.

# MPI\_Send/MPI\_Recv

## PE#0

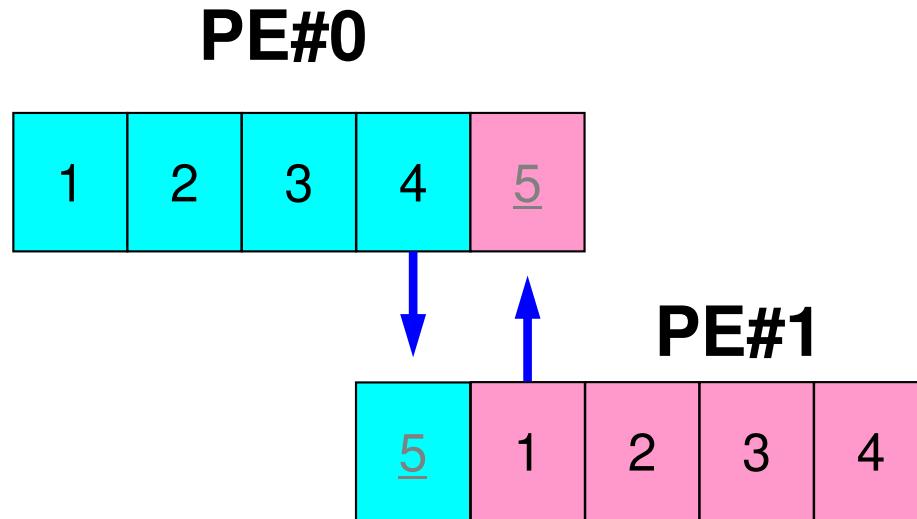

```
call MPI_SEND (NEIB_ID, arg's)  
call MPI_RECV (NEIB_ID, arg's)
```

## PE#1

```
call MPI_SEND (NEIB_ID, arg's)  
call MPI_RECV (NEIB_ID, arg's)
```

- Both of PE#0 and PE#1 are “sending”
- “Sending” does not terminate, if “receiving” at destination is not completed
- Both of PE#0 and PE#1 are waiting for completion of “receiving” after “sending” -> Processes stop

# MPI\_Send/MPI\_Recv (cont.)

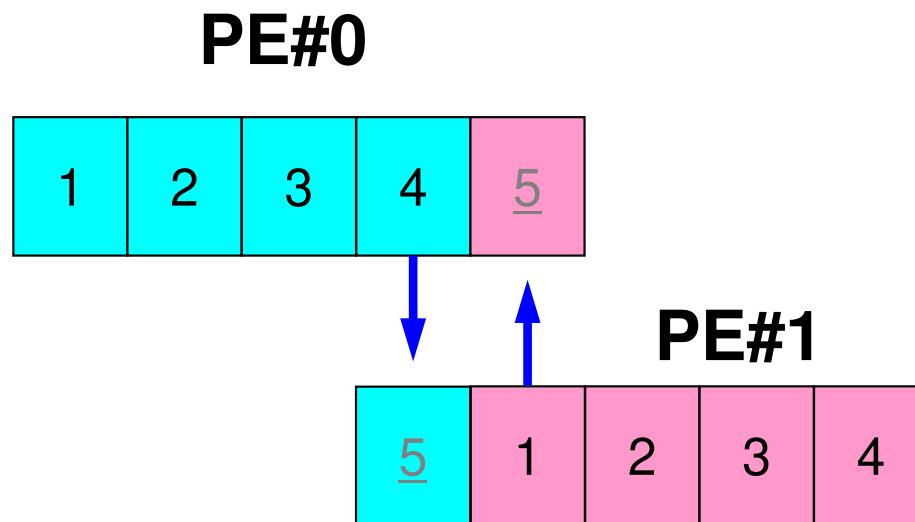

```
if (my_rank.eq.0) NEIB_ID=1  
if (my_rank.eq.1) NEIB_ID=0  
  
...  
if (my_rank.eq.0) then  
  call MPI_SEND (NEIB_ID, arg's)  
  call MPI_RECV (NEIB_ID, arg's)  
endif  
  
if (my_rank.eq.1) then  
  call MPI_RECV (NEIB_ID, arg's)  
  call MPI_SEND (NEIB_ID, arg's)  
endif  
  
...
```

- It works.
- It is OK for Structured Meshes for FDM (Finite Difference Method).

# How to do PtoP Comm. ?

- Using “non-blocking” functions **MPI\_Isend** & **MPI\_Irecv** together with **MPI\_Waitall** for synchronization
- **MPI\_Sendrecv** is also available.

```
if (my_rank.eq.0) NEIB_ID=1  
if (my_rank.eq.1) NEIB_ID=0  
  
...  
call MPI_Isend (NEIB_ID, arg's)  
call MPI_Irecv (NEIB_ID, arg's)  
...  
call MPI_Waitall (for Irecv)  
...  
call MPI_Waitall (for Isend)
```

**MPI\_Waitall** for both of  
**MPI\_Isend/MPI\_Irecv** is possible

# MPI\_ISEND

- Begins a non-blocking send
  - Send the contents of sending buffer (starting from **sendbuf**, number of messages: **count**) to **dest** with **tag**.
  - Contents of sending buffer cannot be modified before calling corresponding **MPI\_Waitall**.
- **call MPI\_ISEND**  
**(sendbuf, count, datatype, dest, tag, comm, request, ierr)**
  - **sendbuf** choice I starting address of sending buffer
  - **count** I I number of elements sent to each process
  - **datatype** I I data type of elements of sending buffer
  - **dest** I I rank of destination
  - **tag** I I message tag  
This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI\_Isend and MPI\_Irecv are matched.  
Usually tag is set to be "0" (in this class),
  - **comm** I I communicator
  - **request** I O communication request array used in **MPI\_Waitall**
  - **ierr** I O completion code

# Communication Request: request

## 通信識別子

- call **MPI\_ISEND**  
**(sendbuf, count, datatype, dest, tag, comm, request, ierr)**
  - **sendbuf** choice I starting address of sending buffer
  - **count** I I number of elements sent to each process
  - **datatype** I I data type of elements of sending buffer
  - **dest** I I rank of destination
  - **tag** I I message tag  
This integer can be used by the application to distinguish messages. Communication occurs if tag's of MPI\_Isend and MPI\_Irecv are matched.  
Usually tag is set to be "0" (in this class),
  - **comm** I I communicator
  - **request** I O communication request used in MPI\_Waitall  
**Size of the array is total number of neighboring processes**
  - **ierr** I O completion code
- Just define the array  

```
allocate (request (NEIBPETOT))
```

Fortran

# MPI\_IRecv

- Begins a non-blocking receive
  - Receiving the contents of receiving buffer (starting from **recvbuf**, number of messages: **count**) from **source** with **tag** .
  - Contents of receiving buffer cannot be used before calling corresponding **MPI\_Waitall**.

- **call MPI\_IRecv**

**(recvbuf, count, datatype, dest, tag, comm, request, ierr)**

- <b>recvbuf</b>	choice	I	starting address of receiving buffer
- <b>count</b>	I	I	number of elements in receiving buffer
- <b>datatype</b>	I	I	data type of elements of receiving buffer
- <b>source</b>	I	I	rank of source

- <b>comm</b>	I	I	communicator
- <b>request</b>	I	O	communication request used in MPI_Waitall
- <b>ierr</b>	I	O	completion code

# MPI\_WAITALL

Fortran

- **`MPI_Waitall`** blocks until all comm's, associated with request in the array, complete. It is used for terminating **`MPI_Isend`** and **`MPI_Irecv`**.
- At sending phase, contents of sending buffer cannot be modified before calling corresponding **`MPI_Waitall`**. At receiving phase, contents of receiving buffer cannot be used before calling corresponding **`MPI_Waitall`**.
- **`MPI_Isend`** and **`MPI_Irecv`** can be synchronized simultaneously with a single **`MPI_Waitall`** if it is consistent.
  - Same request should be used in **`MPI_Isend`** and **`MPI_Irecv`**.
- Its operation is similar to that of **`MPI_Barrier`** but, **`MPI_Waitall`** can not be replaced by **`MPI_Barrier`**.
  - Possible troubles using **`MPI_Barrier`** instead of **`MPI_Waitall`**: Contents of request and status are not updated properly, very slow operations etc.
- **call MPI\_WAITALL (count, request, status, ierr)**
  - count I I number of processes to be synchronized
  - request I I/O comm. request used in `MPI_Waitall` (array size: count)
  - status I O array of status objects  
MPI\_STATUS\_SIZE: defined in 'mpif.h', 'mpi.h'
  - ierr I O completion code

It works, but complicated operations.  
Not looks like SPMD.  
Not portable.

# 2D FDM (1/5)

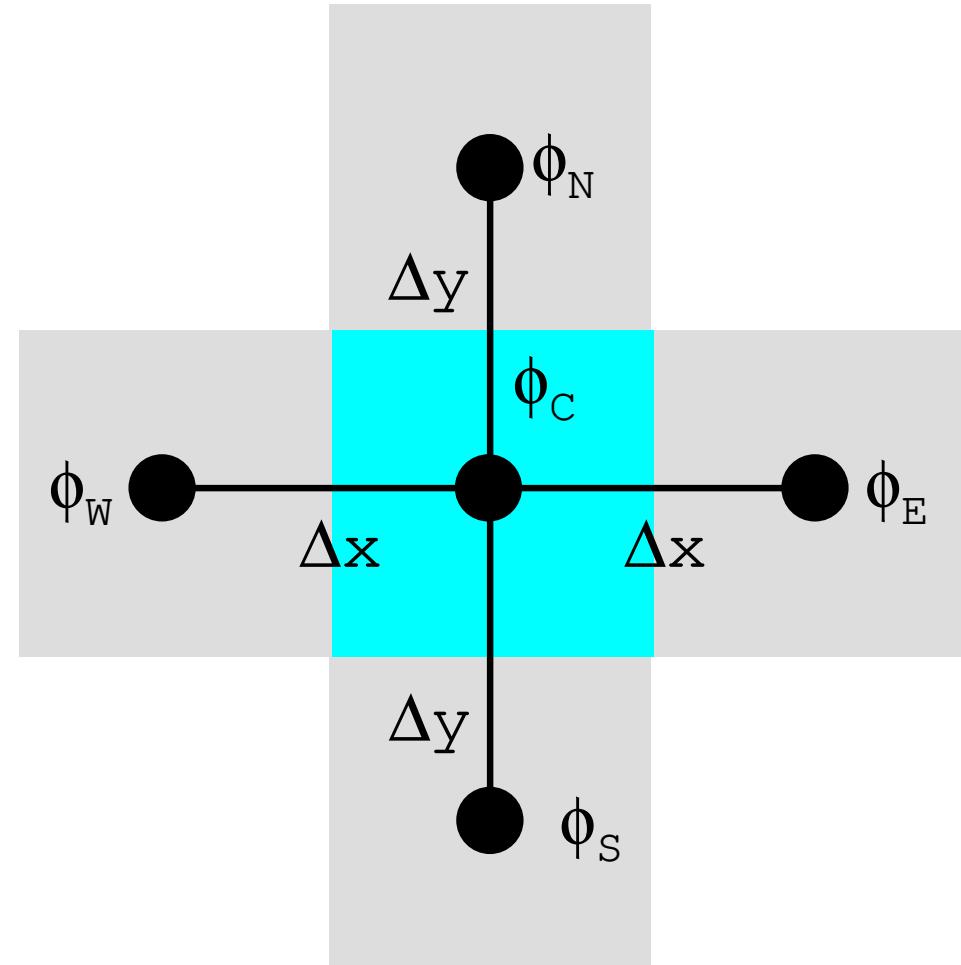

## Entire Mesh

A 10x10 grid of black dots, representing a 10x10 matrix or a 10x10 board. The dots are arranged in ten rows and ten columns, forming a perfect square pattern.

# 2D FDM (5-point, central difference)

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = f$$

$$\left( \frac{\phi_E - 2\phi_C + \phi_W}{\Delta x^2} \right) + \left( \frac{\phi_N - 2\phi_C + \phi_S}{\Delta y^2} \right) = f_C$$

An external point is only sent from its original domain.

A boundary point could be referred from more than one domain, and sent to multiple domains (e.g. 16<sup>th</sup> mesh).

Info. of boundary points is written into sending buffer (**SendBuf**).  
Info. sent to **NEIBPE (neib)** is stored in **export\_index (neib-1)+1 : export\_inedx (neib)**

# Sending Buffer is nice ...

Fortran

```
do neib= 1, NEIBPETOT

Numbering of these boundary nodes is not continuous, therefore the following procedure of MPI\_Isend is not applied directly:

- Starting address of sending buffer
- XX-messages from that address

# Distributed Local Data Structure for Parallel Computation

- Distributed local data structure for domain-to-domain communications has been introduced, which is appropriate for such applications with sparse coefficient matrices (e.g. FDM, FEM, FVM etc.).
  - SPMD
  - Local Numbering: Internal pts to External pts
  - Generalized communication table
- **Everything is easy, if proper data structure is defined:**
  - Values at boundary pts are copied into sending buffers
  - Send/Recv
  - Values at external pts are updated through receiving buffers

# Report S2 (1/2)

- Parallelize 1D code (1d.c) using MPI
- Read entire element number, and decompose into sub-domains in your program
- Validate the results
  - Answer of Original Code = Answer of Parallel Code
  - Explain why number of iterations does not change, as number of MPI processes changes.
- Measure parallel performance

# Report S2 (2/2)

- **Deadline:** January 25<sup>th</sup> (Wed), 2023, 17:00@ITC-LMS
- Problem
  - Apply “Generalized Communication Table”
  - Read entire elem. #, decompose into sub-domains in your program
  - Evaluate parallel performance
    - You need huge number of elements, to get excellent performance.
    - Fix number of iterations (e.g. 100), if computations cannot be completed.
- Report
  - Cover Page: Name, ID, and Problem ID (S2) must be written.
  - Less than eight pages including figures and tables (A4).
    - Strategy, Structure of the Program, Remarks
  - Source list of the program (if you have bugs)
  - Output list (as small as possible)
